was to the overall benefit of ham radio. My first contact as a
ham was on 10 meters USB, and that teased me just enough to
upgrade. I don't think that commercial interests would be too
concerned with whether or not displaced amateurs had to do CW.
The more amateurs you have on the band, the less likely it is
to be taken away.

: My Point: Talk is cheap.. when it comes to Amateur Radio

: USE IT OR LOSE IT...

That's exactly right, and if we have more HF operators, it will
be used a lot more. I know no-coders who have put up repeaters,
established packet BBSes, built satellite stations and more.
Most of them spend more time on the air than I do. Their use
of the ham bands (particularly two meters and 440 MHz) make
those bands less attractive to commercial interests. So, how
often do you get on six or 220? Remember, use it or lose it...

Cheers -- Mark

Hi Cec; So we should reduce requirements (say, by removing code tests) to
increase our strength? This is no different than lowing the voting age to
to maybe 10 to increase the strength of our democracy. Both are a bad idea.

Greetings, all, from New Zealand!

I keep an archive of this Digest on my 24-hrs Packet station
for local Hams who have no Internet. Occasionally (though rarely),
either UCSD or my (Massey) mail server hiccups, and I lose one or
two issues. I would like to keep the archive complete, so am
seeking issues:

V96 #181 (12 May)
V96 #182 (16 May)

If any kind soul has kept these, I would appreciate a copy
(to email address below).

Meanwhile, many thanks to Brian, and to all contributors.

Thanks in advance, and 73 de Dexter, ZL3LH

I disagree. Removing CW requirement would only strengthen the HAM
communities ability to hang on to the frequencies. There is power
in numbers, and removing the CW requirement would certainly increase
the number of active hams dramatically.

[snip]

You may consider there to be double standards in cosidering PGP
signatures illegal, while compressed forwarding is allowed. BUT we
have to operate according to the regulations as laid down in our
country and the Radiocommuniation Authority have said PGP
signatures are NOT permitted. Though approaches are being made for
them to reconsider the situation.

Personally, I do not understand why the signature block should be
so large.

>
> Personally, I do not understand why the signature block should be
>so large.

I'm not sure exactly why this ruling was made in the UK, but it was almost certainly because some radio hams made strong complaints to the RA about the use of PGP signatures. I don't think the RA simply decided, without being prodded, to make a ruling about it. Like everything else with the authorities in this country (and probably elsewhere) if you go along and ask them "Is this legal?" you know what the answer will be!

We now have a situation where the committee of the RSGB that controls packet, refuses to accept messages via packet because they think there is too much of a risk that they will be altered or forged - if you want to comment on anything they ask for it by phone or FAX - but that is the same committee that supposedly made a presentation to the RA about PGP signatures before the "illegal" ruling was made...

The opposition to the use of PGP sigs on packet in the UK, when a few people started using them, was almost hysterical. However the packet network over here is very much dominated by conservative attitudes and a dislike of anything new. Most of those screaming out in opposition clearly did not understand what they were talking about. One main line of opposition was that information could be encrypted and sent as a fake PGP signature attached to a packet message - you've only got to use the system at a very superficial level to know that the fake sig would of course show up as exactly that, and so immediately flag the message as suspicious.

If you actually run a PMS system that can automatically decode PGP sigs, you only need to receive a few signed messages to immediately see the advantages.

As regards the size of the sig block, I don't think it is very large, certainly no bigger than a lot of "brag blocks" that I see on packet.

In conclusion - PGP signatures are probably useful, they're definitely harmless, so why ban them? BUT - Brian is quite right - we have to operate according to our regulations over here, so anyone sending packet messages to the UK should not include a PGP sig if they want them to reach their destination.

There are also a few sats that use 9600 bps G3RUH-style FSK.
You generally need a bit better antennas to work them, but of course
they are much faster.

With 1200 bps AFSK you can only monitor DOVE (at least when it is on),
and of course you can try working Mir when you consider that to be
a PACSAT.

I don't know about buying modems, I build them myself.

Hi Mark, You're the second one today that mentioned we're being threatened with the loss of HF spectrum. What leads you to believe this fallacy? The only loss we've encountered in the last 35 years was the 11 meter band. But what we've gained (12, 17, 30, and all of 160M) far outweighs that loss.

And do we really need an additional 300,000+ hams on HF? You must hate HF to wish that upon us. 600,000 of us can fit nicely on V/UHF, especially if more folks would use simplex like they're supposed to (why blanket 5,000 square miles [assuming a rptr with a 40 mile radius] with your repeated signal when the fellow is within simplex distance of you?). But placing all 600K of us on MF/HF (a mere 3.75 MHz), where if you so much as sneeze half the world might hear you, is foolish. HF is already jammed with wall-to-wall signals, especially on weekends.

And finally, the CW requirement is not obsolete. With it we are assured that *every* HF ham has at least one mode in common. Without it, we're partitioned into a disjoint collection of operators only able to communicate with those who share our favorite mode. That would be a terrible loss of such an important capability.

Jeff KH2PZ / KH6

>Ron N8FOW

Ron, coordination has become a political issue (because it seems to have become embroiled in bandplanning as well as simple technical issues of interference moderation). Some see this as unfortunate, but that's the way it is, so you have to deal with it on a political level. Packet by nature is a cooperative enterprise, so you have the opportunity to build a political base among those participating.

That's what we did here in the South. We formed local, state, and regional groups and alliances. This gave us the political clout to address the bandplanning issues squarely. SERA was reluctant at first to become involved in packet issues, but sufficient political pressure made them realize the necessity of accomodating packet needs in their de facto bandplanning activities. Now SERA's plans to accomodate packet needs are a model the nation would do well to follow.

We started modestly enough. We quickly discovered the drawbacks of simplex packet on 145.01 Mhz, IE hidden terminals, *exposed* terminals, collisions galore, etc. We coopted a 2m voice repeater to become a packet repeater, and that turned out to work very well. SERA guidelines didn't say we had to use *voice* on a coordinated repeater, so we didn't.

Of course there were some howls when people found out what we had done, but scan their guidelines as they would, they couldn't find a reason to shut us down. That got our foot in the door. We built a constituency on the base of that first repeater, and got SERA to acknowledge that packet was as valid a use of a repeater as voice.

Meanwhile, SERA didn't want to get involved in coordinating simplex packet, so they handed a block of simplex frequencies to the State packet groups and told them to manage them. We did. We set up our own coordination system to handle simplex packet. We broke our areas up into LANs (really WANs, but the LAN terminology has become embedded in the amateur vocabulary). We set that up in a quasi-cellular pattern to allow frequency reuse without creating lots of hidden terminals or exposed terminals.

We developed a network to tie the LANs together so that a packet station need never leave its LAN frequency in order to participate in any function available on any LAN. This was *absolutely critical* to our success. In Georgia, this network is owned and operated by GRAPES. This was also absolutely critical to our success. Because the network no longer depends on individuals, it can survive when individuals move, die, or develop other interests. GRAPES is a 501C3 corporation whose menbers are the individual *LANs* serving the State, IE it is a club of clubs.

We had problems, but thanks to packet's inherent ability to share channels, the problems weren't of the same order as those faced by other spectrum users. And because we had already created the political structures to deal with problems, we were able to solve or mitigate most of them.

Eventually, however, as packeteer numbers grew, and as technology changed, we needed more spectrum, and better ways to use that spectrum. By this time, we had impressed SERA that we knew what we were about, and that we could manage large user communities well. They gave us another block of simplex channels to manage. (And they continued to coordinate *repeaters* for packet use, some of our LANs center around repeaters, some center on simplex frequencies, all are tied together by the GRAPES network).

Finally, SERA saw the need to revamp their 70cm bandplan. We participated in this process as full partners. We wound up with 10 pairs of 100 kHz channels in the repeater subband of 70cm, divided half and half between horizontal and vertical polarization. We have the option of using them in pairs as 56 kb digital repeaters, with SERA coordination, or using them as multiple splinter pairs for 9600 baud repeaters, with SERA coordination, or splitting them for simplex use under our coordination umbrella (the latter is to be treated as only a temporary expedient until a repeater can be installed since we have other simplex channels we can use for that where repeater operation isn't permitted).

It took us 15 years to get where we are, it didn't happen overnight, and it didn't happen easily. We had to first gain control of our own community and keep its house clean, then we had to earn the respect and trust of SERA and the other users on the bands. That was neither quick nor easy, but it had to be done to win the political battles needed to put packet, and packet users, squarely on the map as valid players in this spectrum.

There are a number of packet pioneers who deserve most of the credit for making packet what it is in our area. In particular, a lot of the credit should go to the late Dennis Barrow, WB4GQX, who worked tirelessly to make GRAPES a success. Others contributed greatly too, literally tens of thousands of manhours, and hundreds of thousands of miles were driven by the early packet pioneers to make our system what it is today. Some of that was to do technical work, but much of it was to do the political bridge building so

necessary to make a cooperative enterprise succeed.

If you want packet to be better in your area, take heed of the
hard won lessons we have accumulated. Organize, build, proselytize,
lead. It doesn't get done any other way.

Trunking does bring its own set of problems to the table as you
note. And it doesn't address some of the uses to which amateurs
put their radios. It has the benefit of keeping usage high on
a few channels rather than spreading it out over many (mostly
idle) channels, however. This makes it an economic choice for
commercial users since they get the most benefit from their
capital investment. It handles *average* usage well, but fails
when faced with high peak demands, or unusual demands such as
those you note. But it is for those times of high peak demand
and unusual demand that the amateur methods shine. And amateurs
don't have stockholders demanding quarterly returns on their
capital investments, so they can afford to maintain systems
with low average usage.

I'm unaware that most commercial carrier long haul hops have
gone to SS. They do use wideband digital multiplex methods,
but that isn't quite the same. The near-far relation does
present some challenges. It has to be addressed by robust
front end designs. This particular technology has advanced
remarkably in recent years, thanks in no small part to amateur
demands placed on HF receivers and receivers in the VHF
spectrum (see Dr. Rohde's comments on that). On the issue
of DS SS and multipath, a number of techniques are now available
to make SS *more* resistant to multipath than conventional
narrowband modulations. These are still limited by cost to
relatively low information rate channels, but costs are falling
rapidly.

>transmits.

There are better ways. Clearly recognizable and intelligible
voice is possible with a Eo/No of 4 db (see Karn's web page for
a demo), and with carriers that are essentially below the noise
to ordinary narrowband equipment. And the multipath issue can
actually be better for digital SS methods with the right techniques
(and those have already come down in price enough to make them
feasible for low rate information like voice). APCO Project 25
froze too early (as is typical in a rapidly evolving field), and
aimed askew of the proper target in any event. It doesn't allow
taking advantage of the best techniques (similar to the early
freeze of the PC architecture which saddles us to this day with
flaws we have to work around). It is a fallacy to condemn a whole
methodology based on flawed examples.

>>> Or amplitude compandored single side

Well, I tend to agree with this somewhat. We have little need for
ACSSB because we already have SSB, and operators skilled enough
to use it effectively. The benefits we'd derive from ACSSB, freedom
from the need for fine tuning, and the ability to easily trigger
a repeater, don't outweigh the costs involved for our uses. If
our available spectrum were full to the bursting point, switching
from NBFM to ACSSB for repeater usage might make some sense. But
our spectrum isn't that heavily loaded for the most part, and
there are better ways if it were. Linear transponders could
replace repeaters, allowing us to use a mix of available techniques
including SSB, digital, and even FM, where we need range extension
beyond simplex. And SS offers us a method of spectral sharing that
doesn't require formal coordination. ACSSB answers a question which
we have no need to ask. It is a solution to a problem we don't

have.

If most amateur operation at VHF/UHF were one to one over very wide
areas, then cellular or trunking methods would make some sense. But
amateur operations aren't like that for the most part. Amateurs tend
to operate in social groups, gathering around the local "waterhole"
repeater for bull sessions. Cellular technique is poorly suited to
that type of operating, and trunking brings little to that table either.
Both can be adapted to that style, but it is clumsy, has high overhead,
and requires complex fixed capital systems to be operational 7x24 to
support it. With the methods employed by amateurs, there is fallback
to pure simplex, or the ability to move to another independent system,
if a particular repeater fails.

>I might support an ID encoder, manually triggered, that would send
>a ham's call to the repeater he's currently monitoring and a
>decoder at each repeater. If there was a packet link between
>repeaters and approriate software in the controllers, you could
>interrogate any repeater in the system with the call you're
>looking for and a voice synthesizer would tell you what repeater
>to find him on.

An interesting idea, two steps below trunking where the inquiring
user's radio, and that of his quarry, would automatically jump to
an available repeater after the interrogation. While that is more
"telephone-like", the quarry might not appreciate being jerked off
the machine he is using to answer your call. Just letting you know
where he is would seem to be less intrusive. In general, amateurs
don't want systems which are "telephone-like". If they did, they'd
just carry cellular phones. Often, amateurs get on the radio to get
away from the intrusive telephones they've had to deal with all
day.

>bands, it's general.

It is general, but that doesn't mean we can ignore or stifle it simply
because we prefer to operate as grandpa did. We should be open to new
ideas and methods, even if we don't personally want to use them, and
we should make room for those who do to try them out. Who knows, *we*
might have an orginal thought one day (it could happen) and we'd like
others to accomodate our experimentation too.

>>> Why? Is it progress if you have to get out of it's way? If it's

>the way.

Progress often rolls over older ways. In biology, static systems
are dead systems. Technological and social systems can be said to be
living entities after a fashion. And like other living systems, they
must compete in the battle of the survival of the fittest, and evolve
as necessary to accomodate new challenges, or die out. We can attempt
to fight rearguard actions, or march in the vanguard of change, but we
can't hold ourselves above the fray and expect the other contestants
to simply go away and compete elsewhere.

Note: In some cases our old ways may be the better ways for the particular
challenges we face. That's fine, and they'll win an open competition on
a level playing field in that case. What we shouldn't do is stack the
deck to give our older methods an unfair advantage simply because they
were there first, or because they enjoy a current popularity.

I'm a keen proponent of newer techniques, such as digital and SS,
because they bring a lot to the table to meet the challenge of
communicating effectively by radio, but there are times when good
old analog FM is still the right tool for the job.

Your analogy is flawed. Eliminating the testing requirement for Morse code
is more like not requiring a horse riding test to get a driver's license.

Nobody wants to reduce the requirements, just change them to attract
more technical types which would probably increase the difficulty of the
written tests.

Seems to me one of the reasons that pro-code-testing hams want to maintain
the CW requirement is they feel inadequate about their technical knowledge
and are against increasing the technical difficulty of the written tests.
They have chosen to be good in a skill that doesn't matter anymore and are
understandably afraid of the future.

: Ron, coordination has become a political issue (because it seems to
: have become embroiled in bandplanning as well as simple technical
: issues of interference moderation). Some see this as unfortunate,
: but that's the way it is, so you have to deal with it on a political
: level. Packet by nature is a cooperative enterprise, so you have
: the opportunity to build a political base among those participating.
:
: That's what we did here in the South. We formed local, state, and
: regional groups and alliances. This gave us the political clout
: to address the bandplanning issues squarely. SERA was reluctant
: at first to become involved in packet issues, but sufficient
: political pressure made them realize the necessity of accomodating
: packet needs in their de facto bandplanning activities. Now SERA's
: plans to accomodate packet needs are a model the nation would do
: well to follow.

Yup, in Michigan we've been there, done that, it didn't work. The
reality was that in this state it just didn't work out no matter
how much you try to convince people otherwise. Sure we still do have
a state-wide packet coordinating group, but pretty much nobody
follows it. Yes everything was tried within it's capability to get
everyone to work together, but it didn't work.

You get to a point where you just can't tolerate it anymore after
you've done more than expected to try to improve things, and the
result is a failure to do so. That's why I quit packet and decided
to get involved with the very systems that are using the spectrum
so inefficiently... voice repeaters. As the old saying goes, "If you
can't be em', join em'." I did my part to try to improve the hobby
(more than a lot of hams can claim), but I live in a state that
refuses to change anything, so my efforts became pointless and I
learned to not care anymore. Everything you have done that worked
out we have tried and it didn't work, the same goes for a lot of
other states too. I'm glad it worked in your area though.

History shows that the written exams have constantly been dumbed down,
not strengthened.

We were sold a "pig in the poke" once before when we were told that
millions of "technical" people were just waiting for a codeless
license. Well, we created a codeless license -- one that gives
access to 99% of all available amateur spectrum, and one that gives
full operating privs on all bands where "technical innovation"
needs to take place. Yet, no millions of new hams. A hundred thousand
or so, but even then, how many would have come in through the novice
license anyway?

As the saying goes "Fool me once, shame on you. Fool me twice, shame
on me."

We don't need a codeless HF license. One already exists. Its called
Citizen's Band.

One thing I noticed is how we often point the finger at certain groups of people. The no-code techs are not the ones who are pushing for the elimination of cw. It is the same group that got the no code test that all the old timers said we would never see. That group is the radio manufacturers. Vhf and uhf radio sales have went so far up it is astronomical. They were just testing the water then. Now they want to sell ten times as many hf rigs. You see the arrl and the fcc are going to do what the big bussiness man wants, not what the oldham wants. I see cw gone in a matter of a few years. I dont mean gone for good but not required and not as popular as hf and vhf packet. Lets face it cw was at one time the most reliable and most widely used form of communication. But along came the computer,it can send and receive cw twice as fast as a human and can send video, faxes and so much more. Now nearly every hamshack has a computer and not a cw key. Most dont like change but we are responsible for these things. We invented these new modes and one or more is bound to take over.

Things are quite similar here in south east PA and northern DE.
The only way that things seamed to work was to get a few people
together that agree to a way of doing things then do it, then only
let people that will run in the same manner into the system. The
thing that is really bad is that this really only means that we were
getting 1200 bps forwarding off of the 145 channels and onto 222.
Atleast it was an inprovement. I think we'll be putting in 56K soon
but it will be on 1.2 GHz. Things will be done the same way. You
want to run high speed fine but play by the means established. It's
not the best way but in this area it's hard to get 2 BBS ops to
cooperate on anything. The guys running tcp/ip are the only ones
that come close to reality.

Hi,

I wonder if you boffins out there can give me some ideas/information on running packet (AX25) at speeds above 9600.

I am the Sysop (for my sins) of GB7ZZZ.#38.GBR.EU it is a reasonably busy BBS for this area an want to get at least one port onto 9600 and the forwarding link onto something faster as this also carries some DX Cluster traffic. This of course would have benifits to all parites with faster download times etc.

I have read a fair amount from this News Group with regard to links up to 56kb but what they have failed to give is any technical information ie type of modems used, bandwith, radios in use, frequencies, etc. This is really what I am after as it will have to be ex PMR equipment and most likely home brewed as the pocket is not that deep (wife, mortgage, 2 kids at college) I also would like to hear from those of you who have set these links up and built equipment, with the problems, pitfalls encountered.

If there any sites around that could help me with the information that I am requesting would you be kind enough to point me in the right direction.

Many thanks in advance for any advise etc that might come my way.

I am currently learning CW in order to get onto the HF bands. My major interest is in homebrew. CW has three wonderful advantages:

- It is much easier to design and build a CW transmitter (receiver design is not eased as greatly).

- If the bandpass is narrowed to 300Hz or so, the SN ratio is such that low power can go a long way.

- With sufficiently selective receivers (and suitably de-keyclicked transmitters), quite a number of CW channels can be fit into one voice channel.

Now, if all you're interested in is buying your equipment, then CW must be nothing but a burden. But if you're into designing and building stuff (which are the roots of Ham), CW is a great entry point.

Besides, learning CW is very easy (I am doing it now). It seems some people spend more time whining about having to do it than it takes to actually do it!

How many people who complain about doing CW design and build their own equipment? I can't imagine it'd be too many, given the demonstrated lack of patience wrt to learning CW. Stop watching the idiot box (TV), that'll free up lots of time!!! :-)

Does CW really discourage the technically interested/inclined?

Cheers,

Chris (looking forward to getting on the air).

...and these same people cannot spend half an hour a day for a month to learn 5 WPM morse code? How much TV do they watch each week? How much time do they spend just "chewing the rag" each week? Surely it's not really too much to ask.

I'll bet "try it, you'll like it" would work with many, if only they give it a chance.

Cheers,

Chris

PS: I'm currently learning CW, it is not hard, try it (it's actually quite fun).

HP 8920 communications test set, unit was accurate and stable withing
10 Hertz from 60 to 512 Mhz, not bad for 99 bucks, It had some significat errors
around 900 and up, but not too bad say 1 or 2 Khertz. A good buy if you
do the hold switch mod. Not as stable as a Startek or Opto, nor as sensitive,
but we used it to align 9600 baud biz band data radios when the HP was out for service
to within 700 Hertz at 467.

Bruce and the group. Just a short comment: ACSSB has used compandoring for some time and proven that even two to one compression is highly valuable. In fact, two to one could be used with non companded systems effectively and not be too objectionable to non-equipped listeners. Four to one compandoring really improves things! It appears that compandoring is necessary and would have been useful years ago before ACSSB!! 73

If we are to keep our existing frequency allocations, we have to make poorer use of them - that is, we need to waste as much space as we can on the bands we have so that they will be fully justified as being completely in use.

This horrifies me technically, but it make complete political sense. Dammit.

> cbenjam@dinfsvs.com

Hello Curt,

Well, I work digital satellites since a year and a half and I began with FSK / 9600 satellites (KO-23, KO-25, UO-22). They require FM equipment and an standard 9600 terrestrial packet modem works fine. I started working PSK datellites (AO-16, LO-19) about half year ago. They need PSK modems (which are less common) and works at 1200 baud. The advantage is that there are less stations working them. The disadvantage is that you need 70cm SSB receiving.

Please, if you need more specific information, tell me!

Best regards.

Simple. Fire up your packet station on FD. Connect to the cluster. Use the
Announce command. Announce/Local or Announce/Full QD FD de MYCALL
When the replies come back, they come back as Announcements!

Send back your exchange to them by announce!

We have had MANY packet qso's that way in the last three years!

It may not make the cluster sysops happy, but it WORKS!

Big time!

Watch for us this FD from N5TC via the cluster... Same trick...

>written tests.

Fine, increase the difficulty of the exams - I would honestly be in favor
of that. I would especially like to see more formulas included and *not*
allow use of calculators. Basic algebra and extraction of square roots
by hand should have been mastered in the classroom.

>Seems to me one of the reasons that pro-code-testing hams want to maintain
>the CW requirement is they feel inadequate about their technical knowledge
>and are against increasing the technical difficulty of the written tests.
>They have chosen to be good in a skill that doesn't matter anymore and are
>understandably afraid of the future.

What lead you to come to such a conclusion? Gary C. is the only one who
desires that the tests be an "entrance exam, not a final exam." But if
you do make the exams too difficult you might just end up with no one
except technical folks; remember $97.1 asks us to be more than just
technically oriented.

Now if you had asked, I would have told you that keeping the code require-
ment insures us that *all* HF-licensed hams have at least one mode in common
(and one that can be deciphered mentally rather than having to rely on fragile
devices). Delete the code tests and you've partitioned us into disjoint groups
according to our favorite mode. If the Government has to mandate that we have
at least one mode in common, so be it.

Jeff "Keep the code and include more math" KH2PZ / KH6

P.S. Cec, my rebuttal to your "Seems to me..." vision could have been
"Seems to me one of the reasons that anti-code-testing folks are so
against the requirement is that they don't want to master a particular
mental skill when it's less work to allow a machine do it. Too bad they
have to rely on a box to do something that their mind has the capablilty
of doing." But I chose not to include that argument.

P.S.S. Allow the followup to proceed to r.r.a.policy.

The only way to break the typical "there is no activity so nobody
buys or makes a 9600 bps modem, and as nobody has a modem there is no
activity" catch-22 situation is to start activity yourself.
Preferably add a 9600 bps access to the BBS and/or local node, and
advertise it widely. And of course brag about how fast you get your
messages from the BBS :-)

Gary,

We may see some ACSSB stuff in the future. After the turn of the century,
commercial channels are going to be pared down to 6.25 kHz.

Although digital will most likely be the main modulation technique, we might see some
form of ACSSB in the low end commercial gear. And of course, amateurs
are well known for recycling old commercial stuff.

It would be interesting to try SSB on the current FM frequencies, something
like ACSSB, but without the compandering.

73,

Bruce, WB4YUC

In article <31C45E6D.2B68@aloha.net>, Jim Reid <jreid@aloha.net> says:
>
>Anybody have any ideas about how to access a 500 Hz filter
>in LSB mode. My TS-950 will only allow the selection
>of thay filter in CW and FSK modes, but not in either
>SSB modes.
>
>Thanks, Jim, AH6NB
IF your Kenwood is anything like my R2000 and a freinds R5000, They shift
the lo and bfo at the same time. This allows them to use one filter for
both USB and LSB. The shift the freqs by about 1700Hz for ssb and about
1000Hz for cw. If this does not make any sense to you, drop me an Email.
Somewhere I have the test results from when I was trying to add a
Collins Mechanical filter to my receiver. I graphed out the LO and BFO.
Words are starting to fail, but the "mirror" the filter. In the SSB
(for example..I do not have the chart in front of me) the lowest
incoming audio is at the freqency, for USB they switch it around and the
lowest frequency is now "inverted" and is at the high end of the filter.
If you filter is truely symetrical, then USB and LSB will be the same.
In my R2000 that is not the case. The filter shape is far from
symetrical and the radio sounds better in USB than LSB. AMTOR reception
is affected also. I can receive the same signal with no errors in USB,
but in LSB (with my MFJ1278 in rinv) there are a lot of errors.
I hope this makes sense.

True, but attitude is everything! Most of the "old timers" ARE
anachronisms. Just look at the ARRL, and any issue of QST. It's
straight out of the 1930's. Believe me, nostalgia ain't what it used
to be. I've held a licence since 1963, but do not consider myself an
"old timer"I am primarily a listener, because I don't have anything
worthwhile to say.

Hi Fraser,

Take a look at:

http://hydra.carleton.ca/articles/hispeed.html

It's an overview of what's available for 9600 and above, with
descriptions of what sort of equipment is available and what details
are known as of the last update. The 9600/19200/56000 bps info is a
good resource.

If the CW requirement were dropped, then all the no code Hams would have access to the very limited HF bands while being able to use only phone. Thus, aside from there being many more people competing for this limited resource, they'll each always be using five to ten times as much bandwidth (3KHz minimum for phone) because they can't do Morse.

Also, what of the majority of Hams whose English, while good enough to do Morse, is not good enough to do phone? Are you going to insist that they learn conversational English (a hard thing to do) because others don't want to learn the (much easier) Morse?

So yes, if you don't take the CW test, a lot will change.

Cheers,

Chris

I watch maybe 2 hours of TV a week. I still don't have time to invest in something I will never use again in my entire life. IF I would learn code, it would be simply to get on HF and I would commence in forgetting all of it the second I passed the test. Most of my time is spent reading info that I need to pass certifications for my job. I am currently a network and software support tech and I have to CONSTANTLY learn new info and pass new test. What little time I have for ham radio right now will NOT be listening to dits and dahs! But, thats OK, by the time I have more time to spend in the hobby a no-code HF class will most likely be in existance :)

I have recently seen an ad for the MFJ-8621 2meter Packet Only
Transceiver. Its cost is just over $100.00(US) and it looks pretty
nice. I am in the market for a dedicated 2 meter packet transceiver,
(instead of using my HT) and the unit looks good and is priced quite low.

Has anyone used this?

How is the performance?

Can ist really be used as a 24x7 2 meter transceiver?

If you have read this in another thread on the subject, I apologise. There are two important issues wrt HF work, namely limited bandwidth and common language.

If you use phone, you take up at least 3KHz. On VHF/UHF, where you have MHz's of space, this is (usually) not a big deal. But on HF, where you have very limited bandwidth, 3KHz IS a big deal. CW needs about 300Hz, so it is not unreasonable to require CW under these circumstances.

Secondly, given the inherent international nature of HF, do you expect the majority of Hams to learn conversational English, because you don't have half an hour a day for a month? Many people can write/read English (thus, do CW) but cannot speak it. It is far more difficult for them to learn to speak English than it is for you to learn Morse. Non-English speakers outnumber us by far. If you don't want to work international contacts, then you don't need HF, do you?

If you don't have the time now to learn CW, given all your current activities, where would you find the time to set up and work on HF? :-) If you plan on taking time from your other activities to work on HF, then you have the time to learn Morse! Morse really isn't hard!

:-)

Cheers,

Chris.

The "why don't you just buckle down and learn CW" thread is alive and well...

As one of those no-code tech's that has put up repeaters, repaired ham gear, converted commercial gear to ham, etc, here's why I haven't bothered to learn CW:

1) I'm a full-time student, and spend enough time studying science, and don't have the energy at this point to learn CW>

2) I'm not interested in CW. This doesn't mean that it isn't a good mode, isn't fun for others, etc. It just doesn't interest ME. That's what I've always liked about ham radio...there's enough different stuff to interest EVERYONE.

3) I work...a LOT. Currently ~70 hours per week.

4) I don't plan to operate HF any time soon. I don't have the cash for HF gear, and even if I did, I live in an area where antennas are a problem.

So do I ever plan to learn CW? Probably. Will I use it? Probably only to figure out CW IDers on repeaters. I'd like to have an advanced class ticket someday, so I can operate HF when at our club station, and eventually want to purchase a sailboat, which would have HF capabilities. But this is in the very distant future.

Do I think CW keeps the rif-raff off the bands? No...most convicted jammers and problem users are general class or higher. So much for that theory.

Do I like the "I learned it, so you should too" attitude? No, it's archaic. I'm sure many of the older hams know how to use a slide rule as well, but I'm happy with my HP calculator. But if you enjoy your slide rule, then by all means, use it.

Do I favor a reduction in the CW requirement for HF? Yes. If CW must remain, make it a portion of the test just like any other... I can fail everything relating to packet and still pass the exam. Fail the CW mode portion, and I get no upgrade. This doesn't seem fair.

Just my thoughts...

This is a statistical aberration. The FCC generally only polices the
HF bands. Subsequently, any "convicted" jammer the FCC fines will more
than likely be a General class or above than a Codeless tech.

If the FCC policed both V/UHF and HF proportionally according to the
number of licensed hams in those bands, then you might be able to
draw a conclusion about the population of hams as a whole. As it is
now, you can't.

>Do I like the "I learned it, so you should too" attitude? No, it's

Well this is quite an arrogant statement! In this context, MD is attempting to gain the upper hand by belittling Kirk's points. The fact that MD deleted Kirk's statements is an attempt to do so by omission. Notice that MD did not include the ususal <snip for brevity> that is common on USENET. This is usually stated when the responder is not rebutting the snipped staements, but here hs is and takes a cheap tactic instead. Since the statements are not included for the reader to see for himself, the reader is deprived of making an intelligent observation himself and thus must rely one MD's OPINION that is inherent in his statement. This OPINION is played out by using the word "Excuses" which in contemporary American English connotes that it has no value. A common phrase is; "Don't give me any excuses, just do it" which is interpreted as "Don't give me any (lame, unfounded, unreasonable, unworthy) reasons, just do it. The point is that Kirk gave reasons that are valid to him why he is not learning and using CW. To turn it back on MD; If you don't like Kirk's reasons, that's just too damn bad. More than one can play your lame game MD!

This of course is designed not to counter the point made by Kirk but instead to change the topic. The salient point is not in the numbers or the "theory" of the band/user porportionality. The fact still remains is that CW testing has not, is not, and will not in the future be a filter that keeps the riff-raff off the air. Since there are in fact amateurs with license grades that require passing a CW test that are in violation of the law and common decency on teh bands it is proof that CW testing does not filter out these cretins. And that

is the only point that matters since the pro-code testing group purports CW testing as a lid filter and in fact it is not as proven by any significant numbers of these hams being cited.

|>
|>
|> >Do I like the "I learned it, so you should too" attitude? No, it's
|> >archaic.

Once again MD picks and chooses statrements and removes the rest so that the context and other points are dismissed by omission. REALLY cheap and disingenuous. Do I smell desperation?

|>
|> So is SSB (you were aware that SSB is only a few years younger than
|> CW, right?) Seems to me all these complaints just to get access to an
|> archiac mode is energy best spent on other, more productive, activities.

Well gee, one person's few years is a lifetime or more to another. Just going from recollection, Morse Code was invented by S.F.B. Morse sometime in the mid to late 1800s. SSB transmission was invented, when, in the 1950s. Seems like that is more than just a few years to me. So the answer is WRONG! And of course MD must get in another one of his slanted cheap shots with the next sentence. It is unfounded and has no value since the assuption it hinges one is not substantiated.

|>
|>
|> >Do I favor a reduction in the CW requirement for HF? Yes. ...
|> > This doesn't seem fair.
|>
|> Amateur Radio is supposed to be "fair"? Dang! I missed that question
|> on my exams!

Well not it doesn't. And that is why I'm going to do some research and find out just what MD is not capable of learning without a significant amount of effort and I'm going to push as hard as I can to make that a pass/fail requirement. I'm thinking of stuff like Superstring/Grand Unified Field or others known collectively as Theories of Everything. But if MD is a high energy physicist then I'll find something else. It really does not matter that it has no relevance whatsoever to what MD wants to do in amateur radio, since he obviously thinks it is alright for that to be done by his continued support for CW testing.

|>
|> MD

If code requirement is dropped for HF access, then all Hams will be no code and have access to the HF bands (unless you imply new exclusion tests other than code). I fail to see why this is so "transparently fallacious".

>
> Accepting for the moment that CW is spectrally efficient (it isn't),

It is not your raw data thoughput that is at issue, it is the size of bandwidth occupied by each user. Perhaps they might use RTTY. But many will use voice, each taking up 3KHz of space (regardless of spectral efficiency). Morse users take up ~300Hz. That's many more users per band. It's not the speed of data throughput that's important, it's the number of people working on the band. Unless you insist on groups of people using concentrators, why is data throughput important?

> How is it that you can with 100% certainty predict the actions of

It boils down to nothing of the sort. Where did I say people cannot learn? In fact, I imply the opposite - surely anyone can learn Morse! Where do I claim superior knowledge? With the attitude you display in this post, I dare say you probably do more dictating than I.

> ...<SNIP>

So, after mockingly accusing me of having superior knowledge, you go on to imply, from your contact experience, all current CW and future Hams will be able to speak enough English to handle at least voice DX. If not, tough? Nice attitude, as you say. Oh, and exactly right about Morse - it isn't a language, it's much, much easier. I'm sure anyone can learn it (there I go again, thinking others cannot learn).

Obviously I have touched a raw nerve here. Please back off with your unpleasant attitude. I was giving my opinion about why I think the code requirement is good. If you don't like it, that's your right, but please be a little more civilised in your objection.

Chris.

Nice try, but History proves you otherwise.

Over the past decade we've seen more attacks on our VHF+ spectrum,
and no attacks on our HF spectrum. Since the Codeless license already
gives access to the VHF+ spectrum, clearly a Codeless license does
nothing to prevent our radio spectrum from coming under attack.

Next.

NO! If you're going to send a reply to only one guy
don't use use Announce! Everybody
on the Cluster will get that message. Very silly.
Sure, announce will work. But, please use the Talk command to
exchange your reports. Lets not annoy the other users.
Also, use the DX command to Post yourself, as a normal DX spot.
Anybody who wants to "work" you on the Cluster should then
do so with the Talk command.

I'm not sure that there has been a causal relationship established here. I think most jammers, etc... hold higher class licenses because they would be less likely to OWN the HF equipment to jam with if they held a code-free license. The unfortunate fact that they do, just goes to show that even some mental midgets like jammers can learn cw if they want access to HF. Just consider what it could be like without it.

3138. RTTY Source code or help?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-18 00:00:00 UTC
From: rcochran@netcom.com
Message-ID: <rcochranDt6Bn7.Bxv@netcom.com>
Source record: 36384

I'm working on a project that is closely related to decoding RTTY, and I wonder if anyone has some sample source code that they could point me toward to help me.

What I'm doing is building a homebrew DGPS (Differential Global Positioning Service) beacon receiver, for satellite navigation. In a marvel of beauraucratic coordination, the Air Force scrambles the GPS satellite signals to make them less accurate, forcing the Coast Guard (another arm of the DoD) to broadcast corrections to the satellite data, to restore it to the accuracy it would be if it were never messed up in the first place. Commercial DGPS receivers sell for about $500.00, but I'm very close to building one myself with hardware I already have lying around (mine will be more cumbersome and less portable than a commercial receiver, but it'll still fit in a knapsack, which is good enough for my purposes.)

The Coast Guard beacons broadcast the data in the 300kHz range, at speeds of 50 to 200 BPS, using 25 Hz FSK modulation, similar to HF RTTY. I've been able to hook up a cheap MFJ-1225 decoder (no UART, microprocessor, or timer, just a TTL level output that goes high for mark, and low for space) to my Sony ICF-2010 shortwave, and I can get a digital bitstream out, at 200 BPS. The problem is, I've got to break this digital bitstream up into bytes, and send each byte to my GPS receiver at 9600 baud.

What I'm planning on doing is hooking the output of the decoder up to the handshake line(s) of a portable PC's RS-232 port. Then I'll write some software to extract bytes from the handshake lines at 200 BPS, and spit them back out to the GPS at 9600 baud.

This seems like a not-too-complex task, but it is so similar to what has already been done for RTTY decoders, I wonder if anyone knows of some software that I could use as a starting point. I make my living writing C code, but it's been awhile since I've done anything involving timers, interrupts, and serial ports, so I'd much rather reuse and modify existing code than write my own. When I'm done, I'd be willing to donate the resulting software to public domain, or if the original author wants me to keep it a secret, I could do that, too.

If anyone wants more details, please ask. There is also some discussion on this topic going on at sci.geo.satellite-nav.

Speaking for myself, I found the cw test more of a challenge than the written test for extra. I welcome the addition of more technical people to the hobby, and wouldnt mind a more technical written test.I dont think we should lower standards just to increase our numbers.If you dont want to learn cw, then you shouldnt have to, but lets not knock cw operators just because they have a skill you dont.

Sincerely yours
Glenn

> 200 METERS AND DOWN, an inexpensive paperback available from the ARRL.

Please note that I did not refer to CW = continuous wave which is merely a modulation method. I referred to Morse Code = Morse Code specifically. I am as guilty as any of using CW and Morse Code interchangably which is very common but inaccurate, but in this situation I was careful to use the correct term Morse Code since that is what is pertinent and in fact what is tested for in the 1X elements. As a matter of fact when being tested for the 1X elements CW is not being tested since most likely it is coming over tape or being generated by a computer, nether of which uses CW for transmission. In that respect MORSE CODE still was invented far prior to SSB even if it was invented in the 1930s. And I'll look it up tonight in my copy of 200 Meters and Down. As well as history books containing references to Morse Code = Morse Code. Been there done that. I'll have to find it since it has been years since I looked at it. Probaly in some box somewhere. And if I can't recall every date and minutae that is too damn bad, since I did use ternminology that indicated that I was using "ball park" figures. The word "when" in this context generally indicates that I knew that the date was somewhat inncaurate as well as the use of the words "just going from recollection".

Please do study up on American English and commonly used phrases.

And I do know that Morse Code = Morse Code was being used in radio prior to the advent of CW. Can anyone say Spark Gap. Now Jeff, you go look in 200 Meters and Down.

>
> The fact that the riff-raff can learn code just goes to show that anyone
> can. It's no barrier.

Ok, well using Jeff's kind of logic that means that anyone can learn just about anything since someone has done it. This statement just doesn't have any value whatsoever. It also reeks of pro-code testing based snobbery. Since it was apparantly easy for Jeff to do it, then EVERYONE should be able to do it. Well Jeff it just isn't so. I happen to know of a very smart high energy particle Physicist that was convicted of rape. A very disgusting situation. In my book as well as most others he is scum or riff-raff. So I guess that anyone can learn particle physics and quantum chromodynamics. Lets have a test soon!

And since it was not a barrier to you Jeff do not extend that to all. Your experiences are not the be-all, end-all to everything.

As someone considering getting into the world of ham radio, my basic question is this: is it technically feasible to set up a system whereby I could access an internet server remotely with my laptop and shortwave radio from anywhere in radio range of the server? If so, what sort of baud rates are possible, and what kind of maximum radio range are we talking about realistically? Thank you in advance for you assistance.

Geez, that's hard on my eyes. Anyway, comparing the age of a landline mode
to a radio mode is silly. Telephones are older than spark gap xmtrs, but
you use a phone daily, yes? Imagine that! You couldn't survive without
a phone, yet it's a device that's older than spark. Heck, vocal
communication is 10s or 100s of thousands of years old - are you still
using it over the radio? The idea of written communication probably can't
even be dated - yet look at what we're using to convey our thoughts!

>In that respect MORS
>E CODE
>still was invented far prior to SSB even if it was invented in the 1930s.

Yes, and your telephone is older than spark. Silly comparison, Jimbo?

>
>Please do study up on American English and commonly used phrases.

Here in Hawaii the "commonly used phrase" ``ball park figure'' is not used
with a 30-year error. That'd be a heck of a ball park!

>And I do know that Morse Code = Morse Code was being used in radio prior to the

Not only can I say "spark gap", I can and have built one just to hear how
they sounded. Beautiful sounding device!

>> The fact that the riff-raff can learn code just goes to show that anyone

>whatsoever. It also reeks of pro-code testing based snobbery. Since it was
>apparantly easy for Jeff to do it, then EVERYONE should be able to do it. Well
>Jeff it just isn't so.

Oh come now; 15 minutes per day for a week or two will get almost everyone
some HF privileges. At 5wpm you could write each dot and dash and translate
the collection after the examiner stops sending.

>I happen to know of a very smart high energy particle

>as well as most others he is scum or riff-raff. So I guess that anyone can
>learn particle physics and quantum chromodynamics. Lets have a test soon!

Well if there were around 350,000 such rapist/physicists in the US I'd say
there might be a correlation. But we do have about that many coded hams.

>And since it was not a barrier to you Jeff do not extend that to all. Your
>experiences are not the be-all, end-all to everything.

True, but the importance of all hams worldwide having at least one common
HF mode overshadows the small number who can't or won't master 13wpm Morse.
For those folks, they still have free access to over 97% of the US amateur
spectrum.

>>-- End of {email!} excerpt from Jeffrey Herman

The next time you publically post an email of mine let me know in advance -
I'll use more care in my choice of grammar and spelling!

Nice chatting with you over what I thought was email,
Jeff KH2PZ / KH6

Is it at all possible that there may be hundreds even thousands of
poeple out there that don't want to use VHF?(I know, it sound
rediculous) Maybe a no-code HF class will bring more people interested
in long distance comms into ham radio. Look at it from this
perspective, we already have a TON of bootleggers on 10m, maybe if we
can get them a license, we could at least get them to communicate
properly. It is possible, I used to be one of those evil bootleggers
back in Jr. high when I didn't have a real idea of what I was doing.
The CB I had came with "extras" and I figured it was OK to use them.
One time while I was on the air, a ham operator answered my call and
asked me if I knew what frequency I was on. When I explained that I was
on one of my CB's channels, he told me that the freq I was on did not
belong to citizens band. I apologized and didn't "flip the switch" on
my CB again. I'm sure most bootleggers aren't as friendly as I was, but
it doesn't hurt to try!

4S7 - [Sri-Lanka] From June 7 to September 2 , Mario (HB9BRM) will be
active as 4S7BRG.QSL via HB9BRG.
9J - [Zambia] Since June 1st that Hans (KN6DI) is in this country and
will stay in it for a 3 months period.Only SSB.QSL via AA6BB.
CU4_dfp - [Azores] From June 21st to 23rd , CU4AH at "Farol do Carapacho"
Lighthouse, Ref DFP FAZ-004.QSL via homecall.
EM_ant - [Antartida] EM1U and EM1KA are active daily around 18 UTC. on 20m
14,133 Mhz , from "Vernadsky Base".QSL via 9H3UP.
F_iota - [France IOTA] F5TGR, F5TJP, F5TMZ and ON4TH will be active from
the 7 iles group (IOTA EU-107) for the IOTA contest. They will be
on 10 to 80m on SSB and CW.
FR/T - [Tromelin Isl.] During July , FR5ZQ will sign /T from this Island.
QRV in CW/SSB(+-15h UTC 21.300/21.320 Mhz)
GM_iota - [Cumbrae Isl. IOTA EU-123] GM3USL/P will be QRV from this Island
for the IOTA Contest.QSL via GM0KVI.
GW_iota - [St.Tudwal Isl. IOTA EU-106] From 28 to 30 of June , G8JM+G3NQT
+G3JNJ will be on this Island.QSL via G3JNJ.
HB0 - [Liechtenstein] From July 14th to 27th , DL1JBN , DL3JSW and
DK5YY will be QRV on HF (10 to 160mtrs).DG0JAG , DG0JS and DG0OKA
will work on the Satellites.
LA_iota - [Vesteralen Isl. and Lofoten Isl.] From June 16th to July 5th ,

DL2SWW will be in Vesteralen Isl. (IOTA EU-033) . In the period of
28 to 30 of June he will try to be active from Lofoten Isl. (IOTA
EU-076).
N1_iota - [USA Isl.] Chris (N1HRW) will be active June 28 and 29 from
Assateague Is, Maryland (NA-139) and Tangier Is, Virginia (NA-083)
Between July 5 and July 8, Massachuesetts (NA-148) if he gets
permission to land. During this time other islands counting for
the US Islands Award may be activated in Massachuesetts and Maine.
Check the regular IOTA frequencies.All foreign contacts will be
QSL'd automatically through the bureau.Direct QSL's can be obtained
via: Chris Taron N1HRW, 607 Harwood Ct., Champaign, IL 61821, USA
OZ_iota - [Anholt Isl. IOTA EU-088] From 14 to 19 of August , OZ5RM/A and
OZ/SM7KJH will be in this Island.Look for them on 20 and 80 mtrs
CW.
V26_wrtc- [Antigua] A reduced crew of Team Antigua will activate V26B in the
upcoming WRTC/IARU RadioSport Games on July 13th, 1996. They will
be entering either the Multi/single or Multi/multi catagory.
Decision to be made by the crew upon arrival in Antigua .They will
be active for a short time both before and after the contest on all
bands and modes.
The Members and QSL Routes for this Trip will be:
V26B Sam Harner QSL Via WT3Q
V26E Darrel Neron QSL Via AB2E
V26U Bill Hudzik QSL Via WA2UDT

3152. Re: Advantages of CW (was: Re: Assault on Ham Radio - 2m/70cm related to CW !!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-19 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Jun19.140732.5608@ke4zv.atl.ga.us>
Source record: 36398
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

In article <31C5C590.5D2F@bga.com> Chris Broadbent <cfb@bga.com> writes:
>
>I am currently learning CW in order to get onto the HF bands. My major
>interest is in homebrew. CW has three wonderful advantages:
>
>- It is much easier to design and build a CW transmitter (receiver
> design is not eased as greatly).

The same is true for a FSK transmitter, only a varactor separates
a continous carrier (dead carrier) transmitter from a FSK transmitter.
(Alternatively, a shift capacitor and a switching element, IE relay,
transistor, etc, can substitute for the varactor.) Considering that
a CW transmitter must have a keying circuit too in order to differentiate
it from a dead carrier transmitter, the difference in complexity is moot.

>- If the bandpass is narrowed to 300Hz or so, the SN ratio is such
> that low power can go a long way.

It can, if CNR and SNR are the same. However, Shannon's fundamental
relation shows us that *increasing* occupied bandwidth improves SNR
at a faster rate than CNR deteriorates. In the limit case, with infinite
bandwidth, a signal can be perfectly decoded with a Eb/No of -2 db.
Decreasing occupied bandwidth raises the required Eb/No until the
other limit case where occupied bandwidth equals the signaling rate
and SNR=CNR. At that point, the required Eb/No for zero bit errors
is +13 db. (Note that the relation isn't linear, rather it is asymptotic
in the direction of the infinite bandwidth case.) Limiting required
bandwidth to less than the symbol rate (subcoding) requires a CNR
that is greater than the SNR.

What all this means is that we can copy weaker signals if we spread
them over a wider bandwidth, IE wide shift FSK, or in extremis SS,
is up to 15 db better than CW in the limit case. Or we can stuff
more information into a given bandwidth if we're willing to maintain
a higher CNR than the SNR (an example of this is QAM, or more grossly,
AM voice). To maintain simplicity, wide shift FSK (shift 3x baud) gives
us an improvement over CW of 9 db at an Eb/No of 4 db without adding
system complexity to the transmitter assuming a matched filter decoder.

>- With sufficiently selective receivers (and suitably de-keyclicked
> transmitters), quite a number of CW channels can be fit into one
> voice channel.

Yes, but the same is true for FSK, or again as an extreme case, for SS.
And since both of those can operate at a lower CNR, mutual interference
is reduced.

>Now, if all you're interested in is buying your equipment, then CW must be
>nothing but a burden. But if you're into designing and building stuff
>(which are the roots of Ham), CW is a great entry point.

I'd suggest FSK is a better entry point, especially if a good encoding
and a good ECC are used. Performance is better, but the transmitter and
receiver required to be built are virtually the same as for manual Morse.
The only real differnce is in the external coding and decoding system
used. Either a bit of VLSI and firmware is used, or conditioned wetware
is used. The former is much more cost effective than the latter, and
functionally more effective too when used with a better encoding than
OOK Morse.

>Besides, learning CW is very easy (I am doing it now). It seems some people
>spend more time whining about having to do it than it takes to actually do
>it!

Total the number of hours used in conditioning the wetware and multiply
by what your time is worth. Even if you're only worth minimum wage, the
total will be greater than the cost of the higher performance VLSI/firmware
system. And that is also time consumed which could be better spent building
amateur radio transmitters or receivers (or designing and building better
hardware modems).

Note, leisure time is worth more to most people than any other time.
That's why they work so hard all week so that they can have some. So
don't tell me that time spent conditioning wetware is free, it isn't.
It's the most expensive time you have.

>Does CW really discourage the technically interested/inclined?

It is discouraging to see so many believing myths and wasting their
time on inefficient methods. That offends the sensibilities of many
who are technically inclined (and who recognize the myths for what they
are). But more seriously discouraging is the idea that the technically
inclined will have to go through the same rituals in order to do
something more efficient and esthetically satisfying to their sense
of technical fitness.

Yah, not to mention we should all know how to generate log tables by hand in order to do gain-dB conversions, dammit!

You can't possibly have been serious about disallowing calculators. Yes, I once knew how to take a square root by hand. It was tedious, time consuming, and I've never done it once since I passed the math test. So what? I have in front of me all the calculations for a double-tuned bandpass filter. There are four square roots to be taken. Am I a more competent amateur radio licensee if I take them by hand? Will my filter function better?

How about we include some stuff in the tests that will make us better amateur radio licensees? Here's an example:

```
120 ohms
----/\/\/\/----
! !
------12V------
```

How much current is flowing in this resistor? _____

The fact that this simple question is a vast improvement over what we have now is illustrative of how dumb our present system is. No multiple guesses to memorize here. You get an answer in any way you know how, and fill in the blank. Nobody really cares how you get it, as long as you know some way to do it that doesn't involve memorizing the answer to this exact question. The voltage and resistance values would of course be different for every test. It would be almost trivial to program a PC to generate a test like this, complete with an answer key. I don't understand why we're sticking to that archaic "question pool" format.

a bunch of people wrote a lot of stuff on the topic of CW/NO CW and losing our VHF+ and UHF privalages:

OK fellows, keep argueing while they slip in the back door and take the
spectrum. One of the problems I've experienced in ham radio is constant battles amoung factions: ie... Code/NoCode HF vs VHF Packet vs Voice, QST vs 73
PacketGods vs Freespeech ATV vs Weak SIG. need I list more?

We have lost 220, we were promised 902-928 in place of it.
A recent FCC ruleing gave us secondary staus on 902-928 and the
commercial interests could take 902-928 away on a regional basis
if they so choose. 2.4 and 5 Ghz is in trouble. While we are sooo
occupied with arguing, we loose the chance for unity, face it,
Whether or not code exists is not going to stop someone from grabbing
spectrum, nor is proof of advancing technology, the only thing that is going to save it
is public pressure placed on officials not to sell it off, and that must come from
a "grass roots" effort of all of us. So please hold back on the fighting
till we are sure our spectrum is safe.

my 2 cents. Steve N8VKD

So what are syaing is that CW tests are a filter. Maybe not a lid filter, like many see it (though often won't admit it), but as a way to keep YOU from getting crowded on HF. Maybe we need a secret handshake.

>Also, what of the majority of Hams whose English, while good enough to
>do Morse, is not good enough to do phone? Are you going to insist that
>they learn conversational English (a hard thing to do) because others
>don't want to learn the (much easier) Morse.

Well. Thas point has some merit. Some. There are other fields of work that require knowing a specific language to an extent.

Aviation is one field. The "official" language of international aviation (air traffic control) is english. Other languages are used, but for international operations, english is the standard. This does not mean that you have to be able to speak english to become a pilot in your own country - but if you want to leave your borders, it is almost a necessity. China recently announced that starting in about 2 years, ALL of their ATC will be conducted in English.

What does that have to do with ham radio? Am I suggesting we have an international requirement to speak english on amateur radio? No. I am saying that perhaps there is nothing wrong with having a common "language" for certain radio operations. Morse code itself is not a language, but we have a "language" (terminology. prosigns, etc) that uses the code's synmbols. But do we have to require it? Will Morse code die if the requirement is eliminated, or if the speed requirements were just reduced? I doubt it.

Even though I am a no-code "tech minus", I still support the idea of a minimum morse code requirement. What I don't agree with is the

"incentive" licensing structure. What do we gain by reserving spectrum in the U.S. (specifically where phone operations are permitted) for operators that pass a 20 wpm code test?

I have never understood what we gain by having 5 operator classes (excuse me, SIX classes, since tech plus has it's own official status). And save your breath if you think you can tell me why the current structure is a good idea. I have heard all the arguments trying to support it and they have yet to convince me that I should change my mind.

>So yes, if you don't take the CW test, a lot will change.

THE test? We have three of them here. If we elimate two of them, that will change things too. But will it be a change for the worse?

(BTW...you mentioned "the majority" of hams that don't know enough english to use it for phone operations. On what stats to did you base this claim? I am not saying that I know the numbers... But based on the number of hams in the U.S., other english speaking countries, and countries where english is a common second language - I could be easily led to believe that a majority, that is over 50%, of licensed hams in the world can speak sufficient english for phone ops.)

>are possible, and what kind of maximum radio range are we talking about
>realistically? Thank you in advance for you assistance.
>
>-ST

It is technically feasible, though there may be legal problems with the content. On shortwave (we call it HF) you are limited by regulation to 300 baud on all bands except 10m where you are permitted to run 1200 baud (but with the current sunspot minimum 10m isn't very useful for worldwide communications).

But we run *half-duplex*, and there is protocol overhead, so those numbers should be reduced considerably to be comparable to telephone modems. Figure about 100 baud equivalent on most of HF and maybe 400 baud equivalent on 10m (with a clear frequency, contention on a busy channel can knock those numbers down even more). If you can live with that, then you are set. But you probably don't want to live with such low rates so you need to look at other options.

If you look at the amateur VHF and UHF spectrum, you can run baud of 9600, 19.2kb, or even 56 kb. Even given the half-duplex and protocol overheads, the latter speeds are still pretty snappy. But there's a catch, VHF and UHF won't give you worldwide coverage directly. You'll need some form of relay. Now there are terrestrial relay networks in amateur radio, but most of them haven't moved to the higher speeds yet. However, there are amateur radio satellites. The latter can give you realtime hemispheric coverage at times (the high orbit birds), or global store and forward (the little LEOs), but the latter wouldn't be realtime. It'd be fine for Email though.

If all you need is Email exchange, then the Pacsats will serve, or even the slow HF links will do since you don't need realtime response. But if you want to surf the web, you're going to have to be in UHF simplex range (about 50 km) of the wired net connection, or have access to one of the few fast amateur relay networks.

Compandoring does not improve link performance. It merely makes ACSSB sound more "FM-like" to the naive operator by creating a pseudo-quieting effect. While this isn't necessarily a bad thing on strong links, it is detrimental for weak signals.

3158. PMP Port Configuration for Serial Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-19 00:00:00 UTC
From: Jim Mitrenga <cjm009@email.comm.mot.com>
Message-ID: <4q9cl7$nac@brokaw.comm.mot.com>
Source record: 36404

I need the port address and bit position information to initialize the DB9 serial port pin 3 (TXD) for source voltage with a BayCom-style modem to use with the Poor Man's Packet program. The BayCom program automatically programs this pin with a clock pulse to be used in conjunction with summing diodes to power a TMC3105/hex inverter Bell 202-style modem.

PMP is designed to operate via the parallel port but the program is sophisticated enough to provide a means to configure the various serial ports for the same function. Unfortunately, I haven't figured out how to get the TXD pin so that it can be used as one of the voltage sources.

Can you help?

First of all, to accept this logic, I would have to grant you the equivalence between HF and VHF. There is no such equivalence. I'm sitting here chuckling to myself trying to picture UPS trucks, cell phones, and satellites with 40 meter dipoles attached to them - not to mention watching them trying to compete with stations like the VOA and Radio Moscow. The differences in propagational phenomenon are obvious, and the characteristics of VHF and above are no doubt better suited to the proposed applications. That the HF frequencies are used by CW operators has absolutely no bearing on their desirability (or lack thereof) to commercial and industrial users.

The attack you refer to (I suspect) was on a highly underused portion of the 220 band Michael. Had there been more operators there, there would have been more opposition. But new hams can hardly be held accountable for the fact that across the nation there are relatively few repeaters on that band. The fact that the United States is one of the few nations in the world with an amateur band on 220 MHz does make the situation even worse. The equipment is more expensive and less available.

If you want to put up a repeater in the amateur service, one way to go about it is continually to monitor the band for unused frequencies. When you find one, you put up a repeater, and petition the local coordinators to use it. That's essentially what UPS did successfully with the FCC.

These frequencies were targeted as much for their suitability to the proposed application as they were to the degree to which they were used in the existing service.

From this, most reasonable people might conclude that band occupation IS important for holding on to spectrum. The no-code license has obviously created a resurgence in interest in amateur radio, and to deny that this is a good thing for the hobby brings your values into question Michael.

The telephone companies were using SSB by 1926. The first SSB radio
was on the air by 1933. Thus, you've lost all credibility, Jimmy.
MD was right on they money - SSB on landline, and CW on radio -
both came into use at almost exactly the same time.

Thanks for playing Jimbo, and 73 from lovely Hawaii,

Just because amateurs wouldn't have to pass a code test doesn't mean
they won't learn and use code - therefore, your claim appears
fallacious.

I suppose if you're looking at how many transmitters can be active
at the same time without interference, lower bandwidth modes look
better. However, if you're looking at how much information can
be transferred in a given amount of time in a given amount of
bandwidth, CW doesn't do so well.

>> How is it that you can with 100% certainty predict the actions of

>not, tough? Nice attitude, as you say. Oh, and exactly right about
>Morse - it isn't a language, it's much, much easier. I'm sure anyone
>can learn it (there I go again, thinking others cannot learn).

Actually, the reason Morse code crosses language barriers is the use
of a limited vernacular, and it actually forces people to use
enough English to handle at least voice DX. The only thing
Morse offers in addition is the non-spoken communication, which
avoids the problem with accents.

>Obviously I have touched a raw nerve here. Please back off with your

What? Ross seemed a little hot but nothing near what is commonly seen
in the code requirement discussion, especially when code-requirement
advocates start claiming anyone that doesn't learn code is lazy and/or
stupid ;-).

Gary, you're a riot! Let's see, the CW xmtr keyer can be built from a
hacksaw blade. Now what are you going to use to key the FSK xmtr? Can
you build a keyboard from a hacksaw blade? And let's not even begin
to discuss receiving systems. Morse can be deciphered in one's head,
but in 20 years of hamming, I've only heard of one person who could
decode FSK mentally.

There are folks who work cross word puzzles, play computer games, do
math problems, learn a foreign language, etc. All of these activites
involve "wetware" conditioning (silly expression, Gary). How much
could one earn working the hours spent learning Tai Chi?

Now, the hours spend improving one's code speed translates into a
lifetime of learning and fun on the ham bands. Can you place a price-
tag on "fun"?

>Note, leisure time is worth more to most people than any other time.
>That's why they work so hard all week so that they can have some. So

>don't tell me that time spent conditioning wetware is free, it isn't.
>It's the most expensive time you have.

Time spend watching TV falls into that catagory. If one worked on the code *just* during the TV commercials each evening, that person would have an HF ticket within two weeks. Heck, one could conduct their code practice during the morning and afternoon commute.

>>Does CW really discourage the technically interested/inclined?

>It is discouraging to see so many believing myths and wasting their
>time on inefficient methods.

Our voice modes are highly inefficient methods of passing data, yet SSB and FM are the most-used modes today.

>That offends the sensibilities of many
>who are technically inclined (and who recognize the myths for what they
>are). But more seriously discouraging is the idea that the technically

>>
>> What can I do ?
>>
>> How can I reduce the output level ?

I had exactly the same symptoms! I fed the audio through a 75:1 divider and fed the output of the divider into the afsk input on the back of the radio. Cured all the 'rf-like' problems. I believe the extremely low Z output of the KAM is part of the problem. Just pumping up the Z of the load the KAM sees was enough.

It did seem to be an rfi problem at first since the distortion got worse as the power was increased.

Hope this helps.

Hi Phil, I think this was a careless statement. I don't know of any tnc that will equal a good human code operator. I'm working on one, but, so far, it's only better than me. :-) It appears to me that DSP techniques are the only way for CW machines to get the best of most humans. It's something like chess. Machines can beat most people all the time and all the people some of the time but not all the people all the time. But make it Coherent CW, and there is no contest - machines win by a landslide.

The terminal program that comes with the KPC-3 SUCKS!

Try out the paKet 6.1 software!! It's a little late to get it installed
and running before field day, unless you are extremely motivated!!
You can download PAKET61.ZIP from TAPR at:

ftp://ftp.tapr.org/tapr/software_lib/terminal/

For help in installation, check out our Ventura County ARES AREA 8 Packet
Radio Training Course. We have an entire section on paKet, including a
detailed account of the installation process:

What is the amateur service ?
It is a service for the self training of radio operators, a "Contingency Pool".
It is true that CW is barely in use commercially any more, but it will always be a "Contingency Mode"

Contingency operators should know the contingency mode.

It would seem to me that the TRUE reason for wanting the code discontinued is the lack of self motivation, desire and self discipline of the proponents of ending the code.

I learnt the code at 55 and its a lot easier when you are in your teens and twenties.

Nitpicking I suppose, but for the record, there are no exclusive CW
reserves below 30MHz.

> (I already hear a number of SSBers operating
>on the CW realms)?

Many other countries (eg Canada) allow phone in any HF band segement
as I believe.

>A rhetorical question to those who say they wouldn't use Morse, thus it's a waste of
>time. I suppose the same argument can be used for the technical component of
>the Ham tests with most people these days.

Except the technical component is a specific goal of part 97's
definition of the service. No such similar specific relationship
exists for CW testing.

> They buy their equipment, so why
>should they have to learn Ohm's law and all that other "technical" stuff? After all,
>they aren't going to use it.

The technical aspects have far greater application than just
building your own equipment.

>Heck, Radio Shack has radios and antennae off the
>shelf. People are so busy, why should they have to study the tech stuff? Their
>free time is their most valuable time. If they want to build a radio, they're not
>being stopped from studying it, any more than the Morse proponents.

And, as you well might guess, most people do purchase their
transceivers...BUT many also build and or integrate peripheral
items such as power supplies, antenna systems, etc.

>For those unable to read between the lines, I oppose this viewpoint. In fact, I
>believe the tech components should be strengthened. I haven't written a Ham
>exam yet, so no-one can accuse me of trying to create an exclusive club of which

>I just happen to be a member.

I have already suggested, repeatedly, that the simplest improvement in theory testing would be to eliminate the use of specific component values in those sample questions that involve formulas. Doing so would allow for component values to be changed over a wide range and avoid any aspect of memorization for those questions.

>others that would merit attention, it would be very helpful
>Thanks.
>

I have gone through a bit of a TNC odyssey across the years. I started out with a PK-64 which was a nifty unit that worked only with a Commodore 64. Then got a Kantronics KPC-2, then a MFJ 1274, then a Kantronics KAM. Along the way I have also had a Baycom modem and a Paccom Tiny 2. I know there are some others out there, but I feel I have had a fair amount of experience with TNC's.

I believe TNC's can be divided up into three classes.

The first would be VHF, 1200 baud only (although expandability to 9600 might add a subclass here.) The Paccom, KPC-3, MFJ 1270 would all fall under this catagory. They all handle packet about the same and have mailboxes built in so your friends can leave you a message whether you are there or not, or whether the computer is running or not. Personally, I think the Kantronics, with its built in KA-Node is just a bit ahead of the others, but dollar for dollar, they are basically the same.

The second TNC class is not a TNC at all, it is a Baycom Modem. This neat little piece of gear depends on the computer to do all the work, so it won't "stand alone" like a real TNC. Setting up the software, (and there are a few different programs written with the Baycom type modem in mind) can be a bit of a challenge if you aren't comfortable with setting up COM Ports and IRQ's and the like. Also, the basic Baycom software doesn't have a mailbox, and that is a drawback, although some more advanced software does have a built in mailbox. I use my Baycom with my laptop computer when I travel.

The third class of TNC is the multimode controller. The big three are the KAM, the PK-232, and the MFJ 1278. These rigs not only run packet on VHF or HF, but also feature such HF modes as CW, RTTY, Amtor, Pactor, and (on the KAM) Gtor. I am especially partial to the KAM. My search for a TNC that would keep me happy ended when I got the KAM. It does a great job, and has the Kantronics mailbox and KA-Node. If you think you will ever want to work HF, you would be wise to look toward one of these controllers. One nice thing is that you can often find a KAM used for around $150. You might need to upgrade the eprom in it to get the latest features, but you can still get into a used KAM for a good price.

Hope this helps and that you enjoy this aspect of our hobby.

Try building your own BAYCOM serial port modem.
Using just one chip, a TCM3105JL IC, you'll be
able to do KISS and AX25 with appropriate driver
software. Trouble is you'll have to keep your
PC powered up. Perfect task for an old XT or AT
box.

Because it is unpredictable, full of noise, the equipment is bulky, the
antennas large the equipment draws more current to produce the power you need.
And everybody is moving up. Sattelites and digital,spread spectrum,dsp and so much
more. You think learning cw is hard. Have you ever seen the manual that comes with a
good multimode controller?

>
> Don't think so. It sends the same "language" as CW, and CW ops could
> copy it unless you are trying to send it at 100 WPM.

Yeah it sends cw allright and fast too, it will do 100 wpm easy. And on vhf or
uhf it will do it without errors. It will store messages and so much more.

> >You all are just

> we still use it.

A qso via the internet is ham radio if I feel that it is. I am talking to another ham and I can get a qsl card instantly. You are young and you obviously know how to use a computer. Go get a tnc that will do 9600 baud psk and start workin some sattelites. Or work the mir space station or the shuttle. You cant work the mir on cw. Strictly packet or fm voice(kinda makes you wonder doesnt it?) If you have fun with cw I am glad for you. But dont excpect it or hf to be around much longer. And for all of you who want to flame, go fire up your spark gap 100 hz transmitters(oh wait we dont use those anymore)

Happy field day to you also.

Hello All,

Our Packet group PAWNY (Packet Association of Western New York) has
experimented with this transciever at both 1200 and 9600 baud.
The biggest problem we had was the lack of reciever sensetivity.
Only stations with a couple of miles could connect at 9600 and just a
little farther at 1200. Also the power output is an optimistic 5 watts.
Further the rig is crystal controled and one channel only. My advise
for a low cost packet radio is a Radio Shack HTX-202. Fully tunable
digital and has a hot reciever. Aproxiamtely 7 watts with a 13.8v power
supply. Cost $200 compared to $120 for the MFJ. I have use this radio
with a Amplifier TX only no preamp to work the MIR packet station on
a vertial antenna. And can realiably work node 30 miles away. So For
a low cost rig give it a try. Hope this answer some of your questions.
Good Luck and Happy packeting.

3180. KPC 3 software problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-20 00:00:00 UTC
From: dbwillia@uci.edu
Message-ID: <4qa5tb$5r5@news.service.uci.edu>
Source record: 36419

I'm trying to get a KPC-3 running before field day. I can not get the PACTERM software to send commands to the Kantronics KPC3. I've used a demo program KaGOLD and it works great, but it's only a demo program and cuts out after 30 minutes (at least it proved that the TNC functions). My question is, what can I check with regards to the PACTERM software to get it working.

I verified that the baud rate and com port are correct (matching the settings with the KaGOLD demo software) but when I do a CNTL-C to go to the command mode, all I get as a response is a heart shaped character on the screen.
Can someone help me get PACTERM working or send me software that will work well with the KPC3?

Thank you
Brian - N6ZAU

Well Jeffy,

I call you Jeffy in this post since you seem to delight in the childish. Does
that pat on the head feel good now?

One observation:

There are many decaffienated brands available on the market that taste just as
good as regular. You should try them.

Now the following facts that you seem to delight in ignoring in your inane attempt to irritate. Not to mention what you twist and misrepresent in your ever present pursuit of being what ever you are. I can think of two situations:

1) You enjoy being abrasive just to rile people up. In this case well, we all have seen you and your infantile manners. Please, we are all grown-ups here; if you still feel the need to be the center of attention, I'm sure there are many different avenues available right in Hawaii (or is it Guam?) that will be much more satisfying. Some may even get you on the evening news.

2) You actually are this much of a jerk in person as well as on the internet. My question then is: Are you this way naturally, or do you have to practice.

Some facts found in a 10 minute scan of the 1977, 1989, 1995 ARRL Handbooks as well as "Now You're Talking" and the ARRL General Class License manual etc. etc. etc. I couldn't find my copy of "200 Meters and Down" Oh well.

SFB Morse (1791-1892) invents Morse Code. 1838
Later it is modified to resemble todays
Intl. Morse Code, sans prosigns, with help from
Alfred Vail from the original fixed length version.

Time elapsed = 57 years!

G. Marconi generates the first radio waves using 1895
spark gap.

Time elapsed = 6 yesrs

G. Marconi "Opens radio to the World" using spark gap Dec 1901
transmission of Morse Code across the Atlantic.

Time elapsed = ~1 yesr

Amplitude Modulation "invented" via mathematical ~1902
principles.

Time elapsed = 4 years

DeForest invents the triode opens up practical 1906
methods for amplification and therefore CW meaning
continuous waves not Morse Code in that they are
not damped waves as produced by the spark gap.

Fessenden connects a carbon microphone to a 1906 Christmas Day
dynamo and produces the first voice broadcasts.
These were also continuous waves as opposed to
damped waves via spark gap. Albeit a clumsy way
to produce radio frequencies still was cont. wave.

Time elapsed = 13 years

First trans-Atlantic voice AM transmission via 1919
Marconi stations Ballybunion, Ireland, to the
receiving station at Louisbourg.

Time elapsed = 8 years

Sideband first used on trans-Atlantic voice 1927
telephone circuits. Coincidentally, this
the first trans-Atlantic radiotelephone service
also. 150 - 200 kW, 3 min call = $75.

Time elapsed = 20 years

First HAM or amatuer radio use of single sideband. 1947 (Sep. 21)
Between W6QYT @ W6YX to W6VQD on 75m. This is why
I recollected around 1950s. And even more so, the
1950s was when widespread HAM use of SSB came about.

Time elapsed = 49 years

Amatuers around the world are still being tested for 1996
licensure on Morse Code a coding system invented
158 years ago from a man born more than 200 years
ago. Some obstinate amatuers still doggedly argue
the so called "merits" of such an unbelievable practice.

So once again Jeffy, since you don't seem to be able to stick to the point.

The Morse Code requirements, this is not the same as CW, as tested by the 1X elements in the United States are testing a coding scheme, not a mode or modulation method, that is 158 YEARS old. The point here is that it is not CW (a mode) that no-code testing advocates wish to remove, it is testing for Morse Code the 158 year old coding scheme that we are against.

Additionally, CW = continuous wave was used in 1906 using two distnct methods of generation; dynamo and triode amplification. While single sideband was first used, by your own admission in the 1926 - 1927 time frame.

The time elapsed is 20 years. That is TWENTY YEARS BETWEEN FIRST USE OF CW AND FIRST USE OF SIDEBAND.

Now out in Hawaii (Guam?) I've heard from you that 30 yrs is not considered in the "ballpark" so I must assume that 20 years could not be in any way considered "almost exactly the same time".

Well now Jeffy you simply stated earlier that I had no credibility. Simply stating so does not make it any more true than you come across the internet as a nice person. But the question now runs begging:

What is your credibility given that you consider 20 years to be "almost exactly the same time" while 30 years is not in the ballpark? For me it is close to zero when taken with the other posts from you that I have had the displeasure of reading.

Now please to not bore us with more of your... um, "analogies" about spoken language being thousands of years old or of the telephone being almost as old as Morse Code. They are not the same nor are they even able to be stretched for teh purpose of an analogy. Quickly, spoken language is something that is innate in human beings and is naturally present. Children isolated by themselves will

develop spoken language all on their own. It is naturally present in our genetic makeup. Morse Code is not. The analogy with telephone fails since the telephone system is analogous to radio itself since they are both the medium of transmission in their respective domains. Within this "analogy" Morse Code would still be equivalent to speech. Besides, all my phones are digital.

Later, bye, ciao, k-den, whatever,

Jim

P.S. Please let MD rebut his own arguements, at least he is somewhat good at it if not for the entertainment value. You are simply bad at it and are boring.

P.P.S. you are going in my kill file. And please do forge the header info to soemthing like the last time, what was it Iminyourkillfile? The more data points I have, the better.

3182. Help! TS-870 on APRS 10.151?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-20 00:00:00 UTC
From: Phil Scott <72067.3177@CompuServe.COM>

Source record: 36421

I have a Kenwood TS-870 and KAM+....I want to run APRS on 10.151
the region/national? frequency for LSB operation in HF
Packet APRS....in LSB I'll be within the 30 Meter Band for my
General Class License....The 870 says "Oh no, pal...I'm not
transmitting there....it's out of band." I can monitor APRS by
putting the rig in FSK mode and tuning 10.14934...OK for listening
but can't transmit as am working in AFSK via the ACC2 jack. I
called Kenwood for how to work around this and they told me,
"You'll have to modify the radio- that's out of band operation and
unless you're in a Fire Department or Police Department, we
can't/won't tell you how." In fairness the mods are available but
should I have to mod the rig? Can I work USB at some freq w/in
the band help? Help..anybody?

Thanks and 73,
Phil N3KDJ

It is fallacious because your conclusion does not logically follow
your initial premise.

You said:
If code requirement is dropped for HF access, then all hams will
be no code and have access to the HF bands. That is false for the
following reasons:

1. It assumes that because someone did not pass a CW test, that
they will not voluntarily chose to learn and use CW on their own.

2. While elimination of CW testing would immediately allow no-code
techs access to some HF, that access would be limited to the novice
subbands only unless a change in privaledges beyond the elimination of
the CW test was done (i.e. To operate on most amateur HF spectrum
would still require the no-code tech to upgrade to general.)

The antithesis of the No-Code license. Good.
>
>The Basic Class License would authorize use of the 80 Meter CW Novice segment
>only, same power limit as Novice. No other bands permitted.

Why only 80 meters ? Antenna size might be another barrier for
some. Forty meters begins to open up the world to the beginner and
certainly 10m is great for local group practice and l-o-n-g dx when
its open. See great sales opportunities for single-band
transceivers arising from this.

You've broken the code that distinguishes the CB mentally from that spark that leads to ham radio operators.

>Opinions?
>
While you're looking for a way to help those that are mentally disabled, this form of license should be open to all applicants.

I could have been clearer here. My emphasis was on the bandwidth that would be taken by those who would use phone because they could not use Morse. Perhaps they could use RTTY, but how many would (this isn't rhetorical, I have no idea)?

The total space available in the HF bands is very small. Having lots of people using it WITHOUT the ability to use such a narrow band mode as Morse would create much more congestion than if they were to use Morse.

Without a Morse requirement and congestion on the voice bands, how long would the CW reserves remain just for CW (I already hear a number of SSBers operating on the CW realms)?

A couple of people suggested that the proposed HF no-coders would learn Morse once they encountered the congestion. Of this I am skeptical, for if they won't learn Morse in order to gain access in the first place, I cannot believe they'll learn it in order to reduce congestion.

Others have spoken of the spectral efficiency, data throughput, etc. This all assumes that maximum throughput per channel is what is important. I don't believe this is so. It is (IMO) number of people per band that is more important. Besides, what is the spectral efficiency of a voice channel that consumes 3KHz (ideally)?

Why would anyone care if someone cannot saturate their 300Hz slice with maximum data throughput because they can work at only 5 WPM Morse? Are they to have time limits imposed, forcing them to speed? Is everyone to use some digital mode, and in order to maintain maximum data throughput on the "channel", everyone is to be connected to concentrators? Of course not.

Spectral efficiency, Shannon, Nyquist, sampling and signal theory aside, ten CW operators could fit into the space of one phone operator. On HW, this is, I believe, important.

A rhetorical question to those who say they wouldn't use Morse, thus it's a waste of time. I suppose the same argument can be used for the technical component of the Ham tests with most people these days. They buy their equipment, so why should they have to learn Ohm's law and all that other "technical" stuff? After all, they aren't going to use it. Heck, Radio Shack has radios and antennae off the shelf. People are so busy, why should they have to study the tech stuff? Their free time is their most valuable time. If they want to build a radio, they're not being stopped from studying it, any more than the Morse proponents.

For those unable to read between the lines, I oppose this viewpoint. In fact, I believe the tech components should be strengthened. I haven't written a Ham exam yet, so no-one can accuse me of trying to create an exclusive club of which I just happen to be a member.

I'm spending more time on these posts than I spend on a nightly Morse drill. Morse really is not hard. It requires a little time, perseverence and the right attitude. Get a Morse code practicer (better yet, build one) or write a Morse code program. It'll broaden the mind. It is quite fun. The difficulty is not worth all this fuss.

Cheers,

Chris

(much snipping)

I am a no code tech. I am annoyed by the fact that hams accuse no code techs for the future elimination of cw. I personally dont want to learn cw. I dont want to be on the hf bands. I use packet and internet phone to communicate with hams all over the world. We are at a record low sunspot now and dx is hard. One thing that you should realize is that it is not the no code techs but the radio manufacturers lobbying for the elimination of the code. They will sell more over priced hf rigs. The military even stopped using morse code and they are at least ten years behind everyone. Hf communications is almost a thing of the past anyhow. When ham radio first started it was on lower freqs than we use now. We need to look at the real issues here. CW is not the most reliable form of communication now. Packet,Amtor,Pactor and all the new dsp technology is where it is at. Not some unreliable, unpredictable bandwidth hog like ssb is. If I did have a code license I would just let my tnc send it and recv it anyhow, and it would run circles around any code operator. You all are just complaining about something you cannot avoid: CHANGE, most people dont like change but that is what ham radio is all about. You can have your cw and hf. I get more qso's now than I know what to do with. And with windows 95 they will all be more fun. I am talking to a ham in bosnia on internet phone as I type this. He is 5 and 9.
Dont blame the no code techs. Its not like we are all just dyin to get on your beloved low bands and erect some giant 160 meter world beater. Blame the radio manufacturers.

KE4YNN
Brian

Well, if they won't learn code to get onto the HF bands, why would they learn it otherwise? How many no-code techs learn code in their spare time to use it just on VHF/UHF? I would be willing to bet that the number of people who learn Morse code will drop dramatically if the requirement were removed.

Perhaps not, but how does it compare to voice with its 3KHz requirement?

Great, a semantic argument ensues because someone didn't read what I wrote. Re-read what I wrote - I said all no code HF hams would BE ABLE TO use only phone (I didn't consider RTTY, etc. when I wrote that). I did not predict the actions of anyone. I simply stated the obvious. I did not say they'd all, with 100% certainty, do anything.

Of course, if any were to voluntarily learn Morse, then they no longer would be "no code", would they?

True, my followup shifted the meaning of "no code" from 'being unable to do
Morse' (the meaning I used in my original statement) to 'not having passed a Morse
requirement'. I was annoyed. Sorry.

However, my original statement was:

If the CW requirement were dropped, then all the no code Hams would
have access to the very limited HF bands while being able to use only
phone.

With the meaning of the phrase "no code" as 'being unable to do Morse', my
original statement is correct. Those without the ability to do Morse will have
access to the HF bands while being able to use only phone (although they could
use RTTY - that I hadn't considered when I wrote it).

If they learn Morse voluntarily, then they are no longer "no code".

>

The first sentence of 2. agrees with my statement, save the word "some", which implies a limiting statement. No conditional, limiting or grouping within the HF band was mentioned in my statement. No mention of privilege change was made either. They are all irrelevant to my original statement.

If we are to get this picky, then perhaps you too committed a logic sin. I asked why my original statement was fallacious and you then responded that it is fallacious because of the conclusion in that questioning statement. If so, without the conclusion, the original statement is not fallacious. Yes?

Let's rather talk about radio.

Cheers,

Chris.

Oh, there you go again - being nasty. Well, I must ask you this: Why did
you take my email response to you and post it? That wasn't very "grown up"
now, was it!

>2) You actually are this much of a jerk in person as well as on the internet.
>My question then is: Are you this way naturally, or do you have to practice.

Coming from you this means nothing. I recall how you attempted to belittle
MD's remarks by providing improper (wrong) dates regarding SSB and CW.

>Some facts found in a 10 minute scan of the 1977, 1989, 1995 ARRL Handbooks as
>well as "Now You're Talking" and the ARRL General Class License manual etc.
>etc. etc. I couldn't find my copy of "200 Meters and Down" Oh well.

Oh boy, a time line. Can I also add a few tidbits?

Primitive man starts grunting, thus providing a basis
for a spoken language. Pre-history

>SFB Morse (1791-1892) invents Morse Code. 1838

The telephone is invented 1879

>G. Marconi generates the first radio waves using 1895
>G. Marconi "Opens radio to the World" using spark gap Dec 1901
>Amplitude Modulation "invented" via mathematical ~1902
>DeForest invents the triode opens up practical 1906
>Fessenden connects a carbon microphone to a 1906 Christmas Day

Sidebands noted in AM variations 1914

Tests conducted at NAA proved existance of sidebands 1915

H.D. Arnold able to attenuate carrier and upper
sideband 1915

>First trans-Atlantic voice AM transmission via 1919

J.R. Carson at AT&T patented balance modulator 1923

Longwave (60kc) trans-Atlantic telephone service
using SSB 1926

>Sideband first used on trans-Atlantic voice 1927
>telephone circuits. Coincidentally, this

Robert Moore W6DEI and John Williams W2BFD place first
amateur SSB on the air (ARRL's SSB For The Rad. Am.) 1933

>First HAM or amatuer radio use of single sideband. 1947 (Sep. 21)
>Between W6QYT @ W6YX to W6VQD on 75m. This is why
>I recollected around 1950s. And even more so, the
>1950s was when widespread HAM use of SSB came about.

<ding ding ding> Sorry, you lose. You're 14 years too late.

>Amatuers around the world are still being tested for 1996
>licensure on Morse Code a coding system invented
>158 years ago from a man born more than 200 years
>ago. Some obstinate amatuers still doggedly argue
>the so called "merits" of such an unbelievable practice.

And verbal communication began in pre-history, yet we still use
it today. The telephone is almost 120 years old yet we still use it.

>The Morse Code requirements, this is not the same as CW, as tested by the 1X
>elements in the United States are testing a coding scheme, not a mode or
>modulation method, that is 158 YEARS old.

Yes, proven methods seem to stick around for ever, huh? BTW, testing
for knowledge of code didn't start until the late 20s.

>The point here is that it is not CW
>(a mode) that no-code testing advocates wish to remove, it is testing for Morse
>Code the 158 year old coding scheme that we are against.

And the tests are written in English which means one has to know a language
that is several hundred years old.

>Additionally, CW = continuous wave was used in 1906 using two distnct methods of
>generation; dynamo and triode amplification. While single sideband was first
>used, by your own admission in the 1926 - 1927 time frame.

Make that 1915. See above. A 9 year difference. So we see MD was correct.
Don't be a sore loser, Jimmer.

>The time elapsed is 20 years. That is TWENTY YEARS BETWEEN FIRST USE OF CW AND

>FIRST USE OF SIDEBAND.

No no no - 9 years, Jimster. Twice in 2 days you've lost all credibility.

>P.P.S. you are going in my kill file. And please do forge the header info to
>soemthing like the last time, what was it Iminyourkillfile? The more data
>points I have, the better.

What a spoil sport. He knew he was wrong and rather than reading another
correction from me he quits. Phooey.

Jeff KH2PZ / KH6

3191. Re: REQ: Advice on TNCs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-20 00:00:00 UTC
From: cgreenha@magnus.acs.ohio-state.edu
Message-ID: <cgreenha.434.31C936E9@magnus.acs.ohio-state.edu>
Source record: 36430

In article <4q9utu$noi@izzy4.izzy.net> pgc@izzy.net (Peter G. Campbell) writes:

>Hi. I'm interested in getting involved in packet communications
>and would like some advice on some good TNC's to consider.
>Presently I am looking at the Kantronics KPC-3 and the MFJ
>1270C. If anyone has any opinion regarding these units or any
>others that would merit attention, it would be very helpful
>Thanks.

Both of these TNCs are fine choices...I have owned both.

The main difference is that the MFJ is a TAPR clone, hence, the modem
portion is seperate, and can easily be upgraded. The KPC-3 is not a TAPR
clone, hence, the modem portion can not be upgraded to a faster speed.

Some added features of the KPC-3 include...small foot print, internal battery
provision (9vdc), and easy to set deviation (with another KPC-3). If you are
getting a new one, it will come with rev. 7.0 firmware. If you are getting an
old one, try to get at least rev. 6.0 (GPS compatable).

The MFJ can run on very low voltage, and IMHO, has better tone "audio".
If you are getting the "c" 1270, it will run GPS too.

Both are very good entry level TNCs...I dont think you can go wrong, but I
sopose I would run an MFJ for my base, and use the Kantronics as a portable.

But since you are only buying one, you need to ask yourself if you plan on
going to 9600 later, because if you buy the MFJ, it can be upgraded...if you
buy the Kantronics...well...you will be buying another TNC for 9600.

I currenty run a Kantronics 9612 from home...which I recommend if you can
swing the price, its basically 2 TNCs in one.

Take the KPC-3. It is more functional and much smaller. The only reason for taking the MFJ would be if you were going to run a node and now Kantronics has K-Net, which is just as good as TheNET. If you want a bit of versatility and expandability, you could go for the KPC-9612, which would give you all the features of the KPC-3 but also a second port that operates at 9600 baud. Lots of movement in the higher speed area and it may be more useful later on.

>Jim

Jim, calm down. Look at the subject of this message. It's not 'KICK
MD's BUTT'. Mike is a really nice guy. It's just the fumes from all
that Tomato Sauce make him do some really wierd stuff. And if
you think about it, both of the above statements are 100% true.
Mike's very honest:

"Who needs looks when you've got taste ?"

He admits, right here in front of God and the internet how ugly he
is. But that's not his fault, he was born that way. He's just honest.

"If you don't like my opinions, that's just too damn bad."

You mentioned internet standards. If that isn't *THE* internet
standard, I don't know what is. So give Mike a break. He had
a hard day at the factory, jumping up and down in that big
barrel smashing all those tomatoes with his bare feet. Let's
get back to the original subject of this thread, I'm just *dying* to
read some more good 2m/70cm related to CW stuff. I just
can't get enuff of this kinda stuff.

73, Jim KH2D

3194. Re: Assault on Ham Radio - 2m/70cm related to CW !!

Newsgroup: rec.radio.amateur.digital.misc

Hello Everybody,
A couple things...First this is regarding the actual subject of this thread - 2 meters and 440 being THREATENED. EVERYBODY should be writing/calling/E-Mailing/visiting your Senators, Representatives and the FCC, as well as anybody else. DON'T BE LAZY and don't get the attitude of "Well....I'll write later," or "Oh...I don't have to write because there are enough Hams doing it already." We need to make sure this does NOT happen again!
Second thing...ahhhhh yes...good ol` CW. OK, I am 16 years old. I have been licensed since I was 12. 5 WPM was not the easiest thing for me. I failed it at least twice. But yet, I kept trying. Sure I'm young, but ANYBODY can learn and pass the CW tests if they try (Unless they HONESTLY have a mental or physical problem which makes CW impossible to learn)..
Wanna know my secret? Wanna know THE secret to learning CW? Here it is:
- EFFORT-

15 minutes a day does it. That isn't too much time out of people's lives. But yet people still cry to the FCC wanting a No-Code HF license. DON'T TRY TO GET IN OUR HOBBY THE EASY WAY! If you have the effort, you will soon have a piece of paper saying you can get on the HF freqs!
That is all there is to it. I am PRO-CW. I want it to stay as it is. (IF YOU WANT CW TO STAY AS WELL, START DOING THE SAME THING WITH THE BAND THREATS - WRITE/E-MAIL THE PEOPLE WHO HAVE THE AUTHORITY TO CHANGE ITS REQUIREMENTS!! I AM!!)
Save the flames, but feel free to send me your opinions. If you are pro-CW or anti-CW, or dis/agree with my message, LET ME KNOW WHY. I'm tired of excuses!
Best of 73,
Brian, N5ZGT

CW FOREVER!!!

>Can ist really be used as a 24x7 2 meter transceiver?

A buddy of mine and I each ordered one back in March. His arrived Tuesday,
mine hasn't shown up yet. The cable he got had a couple of pins wired
incorrectly so he spent a fair amount of time scratching his head over why
it wouldn't Tx (PTT and Rx were reversed) I'm hoping mine will show up soon
;-)

Someone else here in town is running one 24x7, but until I have had a chance
to see it in action, I won't really know.

>Brian - N6ZAU

Brian, the KPC3 is in host mode. You need to have PACTERM reset it to
terminal mode. You can do this by starting PACTERM, setting up the
correct com port and typing the following sequence:

(make sure NUMLOCK is on, on your keyboard)

Hold the ALT key down and type 192 on the keypad,
release the ALT key and type the letter q
Hold the ALT key down again and type 192 on the keypad

The KPC3 should go back into terminal mode.

(I just verified this on my KPC3)

Hey Tom, I'm having a hard time with your logic. You want to make the service more technically competent by promoting outdated, simple-minded modes? IMO, Morse code makes the ARS a lot less technically competent.

>Now, if all you're interested in is buying your equipment, then CW must be
>nothing but a burden. But if you're into designing and building stuff
>(which are the roots of Ham), CW is a great entry point.

Yep, I've been saying that for quite a while. If we're supposed to be a technically competent service, promoting modes that simplify understanding of basic radio concepts can only help us. Being elitist, and shunning code for computers, will turn us into an appliance operator service.

>Does CW really discourage the technically interested/inclined?

Good question. I don't know the answer, but I can say that the majority of hams I know who are technically inclined (into homebrew on everything from HF up to 10 GHz) have no problem with code. I don't think most of them really thought twice about it... if you wanted the privileges, you learned the code. Idealogical arguments are all very well, but at some point you have to be practical if you ever want to get anywhere, and these folks wanted to.

Standard Code Wars disclaimer: None of this has anything to do with code testing. I think we should think about whether government still has any need to test amateur licensees for code proficiency. That's the bottom line reason why we get tested for anything at all. I agree that there's pretty much nothing else keeping HF from become one vast CBer wasteland at this time, but we can eliminate memorization from the theory tests to change that.

> they could use RTTY, but how many would (this isn't rhetorical, I have no idea)?

Obviously, more and more amateurs are using digital modes. I have noticed
many complaints these days of those who are devoted entirely to OOK Morse
code communications of the incursion of digital signals into spectrum that
was once considered sacrosanct preserves of CW. Little do they realize that
more and more amateurs are using digital modes resulting in greater demands
for more spectrum.

>
> The total space available in the HF bands is very small. Having lots of people using
> it WITHOUT the ability to use such a narrow band mode as Morse would create
> much more congestion than if they were to use Morse.
>

Indeed, there is a replacement for OOK Morse communications - Baudot, the TOR
codes and Clover come to mind. Aside from the fact that theses modes have
greater throughput, some of them also get through when Morse code will fail.

Regretably, this comparison of the necessary bandwidth for Morse code and SSB
communications is a narrow (no pun intended) view of the overall merits of
the two emissions. For the most part, it is like trying to compare apples
and oranges.

> Without a Morse requirement and congestion on the voice bands, how long would
> the CW reserves remain just for CW (I already hear a number of SSBers operating
> on the CW realms)?
>

As I had mentioned earlier, they are already getting progressively smaller as
more amateurs are using modern communications techniques.

> A couple of people suggested that the proposed HF no-coders would learn Morse
> once they encountered the congestion. Of this I am skeptical, for if they won't
> learn Morse in order to gain access in the first place, I cannot believe they'll learn
> it in order to reduce congestion.
>

I join in Broadbent's skepticism because I too feel that if the spectrum
becomes too congested, it is unlikely that they will turn to Morse code. I
believe that those who are dissatisfied with SSB due to overcrowdingwill do
one of two things - develop an even more efficient radiotelephone technology
(perhaps Spread Spectrum implementation), or will look to the digital modes.
Considering the ineffeciciency of Morse code, there would be few that would
wish to devote the time and effort to learning that mode as a solution to
the overcrowding of the radiotelephone bands.

With that in mind, since Morse code is anachronistic, why should the
government continue to demand that amateurs learn the Morse code (current
international requirements aside)? Quite frankly, governments couldn't care
less what mode amateurs use. Even in the U.S. where sub-allocation is
mandated by law, there is no requirement for an individual to use Morse code
after having passed the test in order to gain access to HF operation. Since
governments don't care one way or the other which mode amateurs use,
Broadbent points out the real dicotomy of Morse code testing in amateur radio
testing. That dicotomy is that Morse code testing is the means by which
access to the radiotelephone bands is restricted, otherwise they would be too
crowded.

The prevention of overcrowding did not work then when it was attempted fifty
years ago, and it is unlikely to have much more success in the future. In
the past, amateurs got around the overcrowding problem by using SSB, better
filtering and the like. Attempting to prevent overcrowding would have the
negative impact of stifling creativity - if there is no overcrowding, what is
the incentive to investigate more spectrally efficient techniques, whether
phone or data?

> Others have spoken of the spectral efficiency, data throughput, etc. This all
> assumes that maximum throughput per channel is what is important. I don't
> believe this is so. It is (IMO) number of people per band that is more important.
> Besides, what is the spectral efficiency of a voice channel that consumes 3KHz
> (ideally)?
>

This assumes that we amateurs have reached the pinnacle of spectrum
efficiency where 3 kHz is the minimal limit for radio communications.
Besides, considering that English is spoken at a rate of 120 to 150 words per

minute, then the same amount of spectrum would be required for ten 300 Hz channels at 15 words per minute. So how indeed is Morse code more efficient than radio telephone under those circumstances.

> Why would anyone care if someone cannot saturate their 300Hz slice with maximum
> data throughput because they can work at only 5 WPM Morse? Are they to have
> time limits imposed, forcing them to speed? Is everyone to use some digital mode,
> and in order to maintain maximum data throughput on the "channel", everyone
> is to be connected to concentrators? Of course not.

I agree with Broadbent's view, there is no justification for dictating which mode must be used, they are all optional. Therefore, since the use of Morse code is optional, then it does not follow that it knowledge should be mandatory.

>
> Spectral efficiency, Shannon, Nyquist, sampling and signal theory aside, ten CW
> operators could fit into the space of one phone operator. On HW, this is, I believe,
> important.

But if all these other factors are brushed aside, then conclusions reached will be false. It would be like ignoring all other factors and deciding upon the purchase of a car based on the location of the muffler.

>
> A rhetorical question to those who say they wouldn't use Morse, thus it's a waste of

> being stopped from studying it, any more than the Morse proponents.
>

In fact, the technical testing is important because of the government's legitimate interest in ensure that amateurs do not interfere with other users of the radio spectrum. Whether the individual wishes to use a home brew rig or a commercially available radio has no bearing. The bottom line is to ensure that the amateur is competent enough to stay out of trouble.

> For those unable to read between the lines, I oppose this viewpoint. In fact, I
> believe the tech components should be strengthened. I haven't written a Ham
> exam yet, so no-one can accuse me of trying to create an exclusive club of which
> I just happen to be a member.
>

If few sources of the sources of interference originate from amateur stations, then advocating increased technical requirements is questionable. If amateurs are causing interference, then it is justifiable; otherwise it would be an unjustifiable barrier.

> I'm spending more time on these posts than I spend on a nightly Morse drill. Morse
> really is not hard. It requires a little time, perseverence and the right attitude.

> It'll broaden the mind.

I disagree with Broadbent. When one hears "didah", one immediately writes
the letter "A". There is no broadening effect upon the mind.

>It is quite fun.

No doubt that to Broadbent, Morse code is fun. But he is not in a position
to project his views upon all his other fellow human beings.

>The difficulty is not worth all this fuss.
>

More to the point, advocating mandatory Morse code testing isn't worth the
fuss.

From: D.N.Muir@massey.ac.NZ
Message-ID: <199606201057.DAA19442@UCSD.EDU>
Source record: 36442

Greetings, again, from New Zealand!

I sent this a few days ago, and have had replies (thanks!):

> I keep an archive of this Digest on my 24-hrs Packet station
>for local Hams who have no Internet. Occasionally (though rarely),
>either UCSD or my (Massey) mail server hiccups, and I lose one or
>two issues. I would like to keep the archive complete, so am
>seeking issue:
>
>V96 #181 (12 May)
>V96 #186 (16 May)
>
> If any kind soul has kept this, I would appreciate a copy
>(to email address below).
>
> Meanwhile, many thanks to Brian, and to all contributors.

Since then, I have had another hiccup, and am missing

V96 #231

If some kind soul could repeat the exercise... ?? :-)

A further note: Yes, I have looked in the Archive, and occasionally
manage to avoid posting like this by getting back-issues there. These
ones, however, are not present: it seems the Digestifier only archives one
Digest each day, though it can post more than one (it sometimes hiccups even
on the usual one, too). Much valuable information can be lost :-(
Brian says there is a re-organisation in the wind, and hopefully this
will improve the situation :-)

I also archive Ham-Ant and TCP-Group from UCSD, and NOS-BBS from
hydra.carleton.ca 's listproc (UCSD is a listserv), and similar problems
occur there, too, though not so seriously as they usually only Digest once
per day.

Thanks in advance, and 73 de Dexter, ZL3LH

==========comments GM0CSZ / KN6WH
Chris ,I agree that CW operation enables operators to use relatively
simple equipment which can be homebrewed. I don't think that CW
lovers are more or less technically inclined than others. As it comes
over to me ,the whole CW requirement dialogue centers around that ,
when the morse test requirement would be dropped :
1) CW operators fear that the HF bands will be overcrowded in general
and that this overcrowding will result in the CW segments being squeezed.

2) Quite a number of HF operators resent that with a no code licence
for the HF bands ,the new generation of HF operators would get it 'for free'
I call this the 'jalousy factor'
However I agree that with a little effort anybody can learn morse code.

Inspite of being very much pro CW incl. QRP operation , I feel that with the abandonment of manual morse telegraphy by most if not all of the non amateur users of the HF spectrum , morse code should no longer be a requirement for hams to use the HF bands ......the world is moving on .

>
>How much current is flowing in this resistor? ____C___________

A. (120 - 12) amps

B. (120/12) amps

C. (12/120) amps

D. (120*12) amps

This would demonstrate to my satisfaction that the testee knows how to
calculate the current flowing through the circuit, and this would be an
acceptable multiple choice answer/distractor set.

Multiple choice is a fact of life, and has been shown to be an effective
way of measuring a person's knowledge. It's effectiveness is dependent
upon the wording of the question however. I think the VEC's have overall,
done a great job at formulating the exams, and are continually striving for
improvement.

If the question pools "cause" memorization, then lets provide some
questions worth memorizing. Personally I must confess to having
memorized ohms law many years prior to taking my ham exams. So what if
people memorize V=I*R and XsubL=2Pi fL for their ham exams?

The only concern I can foresee with these types of questions would be
from those who are concerned that hams would no longer be required to
demonstrate their ability to use a calculator. A minor point, but not an
insurmountable problem either.

>We are at a record low sunspot now and dx is hard.

No...DX is EASY now! You should be listening to 10 meters. Conditions
are good enough that there is even DX on 6 meters! Don't assume that
just because there are not many sunspots then that means that there is
no DX.

>One thing that you should realize

>anyhow, and it would run circles around any code operator.

Don't think so. It sends the same "language" as CW, and CW ops could
copy it unless you are trying to send it at 100 WPM.

>You all are just
>complaining about something you cannot avoid: CHANGE, most people dont like change but

>Dont blame the no code techs. Its not like we are all just dyin to get on your beloved
>low bands and erect some giant 160 meter world beater. Blame the radio manufacturers.

We aren't blaming the No-coders completely. We are blaming those
who are too lazy and can't take 15 minutes out of their lives to learn
CW. I'm 16. I even had a hard time with it. ANYBODY can learn the
code if they put in the little time and effort that is needed.
(Unless you HONESTLY have a mental or physical problems that makes CW
impossible to learn). I failed the 5 WPM test 3 times, but didn't give
up. Same with the 13. I'm going for the 20 here in a couple months.
You get more QSOs on the Internet, but it isn't Ham Radio. Ham
Radio has something magical to it. So does HF. And if you have never
tried it, you don't know what you are missing. You may say CW is

outdated, but if I'm not mistaken, so is your combustion engine, but
we still use it.
The point is, EFFORT is the only thing needed to learn CW. And many
(NOT ALL) No-Coders don't give the effort and they wonder why they
can't learn CW. I was a No-Coder. I know many who were as well, and
now we are on HF. ANYBODY CAN DO IT! And if you do it, you won't have
to rely on the telephone lines to make your "QSOs" the easy way.
73 and I wish you luck,

3211. Problem with PK-12 TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-21 00:00:00 UTC
From: hopkins@dfw.dfw.net
Message-ID: <4qcqfk$cdj@fnord.dfw.net>
Source record: 36307

I just bought an AEA PK-12 TNC at Dallas Ham-Com a week or so ago and I'm having a strange problem. I connected it up to the radio, an Alinco DR-1200, and the computer, an old XT running CrossTalk, and proceeded to connect to my favorite ROSE switch to pull up a heard list. It connected immediately, but no list ever displayed and after swapping about ten RR frames, the ROSE disconnected me. I then tried to connect to the TexNet node with about the same result. I can connect to myself via a local digi, to other individual stations, and to a local Ka-node. I thought maybe the ROSE didn't like my deviation (which I set at 3.6 KHz with a service monitor) or I didn't like his, so I tried connecting through the previously mentioned digi - same result. But when I connected to the Ka-node and then used it's connect command to connect to ROSE, there's my heard list. AEA tech support is mystified by it and they're going to have a programmer call me next week when he returns from vacation, but in the meantime, has anyone else had such a problem or does anyone have any ideas for a solution (other than another brand of TNC, which will be the solution if AEA doesn't come up with something - I'm not pleased with their support so far.)

TIA & 73,

Jim, N5BFD

While I agree that fewer amateurs would learn Morse code in the absence
of a requirment, keep in mind people sometimes tout the advantages
of CW. If CW has advantages, people will learn it in the absence of
a requirement; if people aren't learning it in the absence of a
requirement, there probably aren't advantages.

As for "how many techs learn code to use it on VHF/UHF?", how many
amateurs use CW on VHF/UHF in the first place? There's very little
CW activity on VHF/UHF, apparently mostly on 6m and 2m, and this is
historical, not due to the dropping of the code requirement from the
Technician class.

Perhaps the increased level of CW activity on HF is enough to cause
people to learn code, regardless of the requirement.

>>I suppose if you're looking at how many transmitters can be active

>
>Perhaps not, but how does it compare to voice with its 3KHz requirement?

Well, assuming that people speak at around 250 WPM (my sister, an
educator, supplied this estimate) it appears that CW and phone may
have roughly the same spectral efficiency.

What's your point?

>>>> How is it that you can with 100% certainty predict the actions of

>Great, a semantic argument ensues because someone didn't read what I wrote.
>Re-read what I wrote - I said all no code HF hams would BE ABLE TO use only
>phone (I didn't consider RTTY, etc. when I wrote that). I did not predict the
>actions of anyone. I simply stated the obvious. I did not say they'd all, with 100%
>certainty, do anything.

Given that "no code HF hams" could be reasonably interpreted as "amateurs on HF
that have not passed a code test", I don't think I misread what you wrote. In
fact, even amateurs that don't know a single character of Morse could
use a multi-mode TNC to operate CW. If what you meant to write was
"all amateurs on HF that don't know code won't be able to send or receive
it by ear", it wasn't obvious.

>Of course, if any were to voluntarily learn Morse, then they no longer would be "no
>code", would they?

As mentioned above, that depends on what is meant by 'no-code' - if it means
'do not know code' then you're correct; if it means 'never passed 1A/1B/1C',
which is a reasonable reading, you're incorrect.

: > it.
: > Jim, WA7NDD.

: Very good points, which is why I am in favor of the NII proposal at 5 GHz,
: even though the current NPRM doesn't go far enough in my mind. Hams are in an
: excellent position to provide NII links, and something like that might breathe
: new life into the hobby.

: Unfortunately, the ARRL will do it's usual short-sighted knee-jerk and try to
: kill it, even though that will be just another nail in our hobby's coffin.

I too am in favor of the NII proposal at 5 GHz. I see a possible
future for amateur radio as providers of "universal access" parts of
the information super goat path.

Seriously, if hams could get their act together, we could provide a
high speed radio network with full mobile access capability that
rivals anything produced by commercial organizations. Once we get the
technology working, it could then migrate to using part 15 licensed
radios and provide a real social benefit.

However, this will mean that hams will need to learn about modern
modulation techniques, and network protocols unlike the current packet
radio toys.

Gary Coffman gave an extensive technical answer to this question. However
there is another consideration. When I first set up my packet station I
connected to the local net via a hamgate, and thought it was pretty neat,
even if not fast (on 2 m @ 1200 baud). However I quickly realized that I
had compromised my passwords, since anyone could read them. So I logged
off, dialed in, and reset passwords. That was the first and last time I
tried that.

Brian, I am sure you have already found out that Jeff has given you good advice, so I won't restate it. But I did want to pass along some thoughts on software for your KPC3.

As you have already seen, the KAGold is a super program, it has to be good for the price they ask for it! Before I bit the bullet and got it, I ran PaKet6. It is an excellent shareware program, has a built in mailbox, supports script files, etc. You can get it from several places on the internet.

That Pacterm is about as plain jane as you can get. If you learn to run your tnc with it you will be like a person who started off learning to drive a stick shift -- you should be able to run about anything!

I will also mention that you can run your TNC with a telephone terminal program too. If you are in a hurry to get going and already have a terminal program you are used to you might save some time going that direction. I wouldn't recommend it for long term use, but still, it will get you on the air.

For a long time I wondered from one TNC program to another. I tried every one I could get my hands on. When my friends started raving about KAGold I held off because of the money, but when I tried it I was hooked! Of course, this is with a KAM and doing a lot of HF work including Pactor which is a blast.

Hope this helps at least a little!

Maybe this is a clearer request for info. If anyone is using the Apple II for packet, a young ham in the area wants to know what TNC and software you are using. E-mail me at mepstein@carol.net

Thanks much and 73,

Mike

>they could use RTTY, but how many would (this isn't rhetorical, I have no idea)?

Probably not RTTY (that's dying out), but certainly PACTOR, GTOR, and
Clover. Digital mode operation is now used by over 22% of amateurs on
HF (ARRL survey), and growing rapidly. Throughputs range from 6 to 40
char/sec, or roughly 72 to 480 WPM, well above the capabilities of
Morse users. And they can operate at CNRs where most Morse users give
up. While voice, at 120 WPM, is faster than Morse, some of the newer
digital methods put voice operation to shame while consuming considerably
less bandwidth.

>The total space available in the HF bands is very small. Having lots of people using
>it WITHOUT the ability to use such a narrow band mode as Morse would create
>much more congestion than if they were to use Morse.

Sure, but better methods than Morse exist, as noted above, which don't
require wetware modem conditioning. Morse is *one* narrow bandwidth
option, but certainly not the only one (nor the best one).

>Without a Morse requirement and congestion on the voice bands, how long would
>the CW reserves remain just for CW (I already hear a number of SSBers operating
>on the CW realms)?

There aren't any "just for CW" reserves on HF *now*. Only 50.0-50.1 MHz
and 144.0-144.1 MHz are CW exclusive amateur band segments, and they don't
require a manual Morse speed test for access (ironic, no?). On HF, there
are two different subband types by emission for US amateurs. There are the

voice/image segments and the RTTY/data segments. CW operators tend to crowd into the RTTY/data segments in preference to the voice/image segments, but they don't have any exclusive claim to either type of segment on HF.

Some of us have proposed setting aside the lower 25 kHz of each band as a CW exclusive sanctuary so that CW operators won't fear being crowded off the bands by other modes should we eliminate Morse testing. But to date, none of the CW test forever types have cone forward to support the idea. (These segments would be like the current 6m and 2m CW exclusive segments in that the only test of Morse speed required is the one conducted on the air every time you try to make a contact.)

Note, the SSB you hear in the "CW segments", is probably foreign operation. Most contries don't have the elaborate by mode subbands with which the US operator is burdened.

>A couple of people suggested that the proposed HF no-coders would learn Morse
>once they encountered the congestion. Of this I am skeptical, for if they won't
>learn Morse in order to gain access in the first place, I cannot believe they'll learn
>it in order to reduce congestion.

I don't think so either. There are much superior non-voice methods available than manual Morse. Morse is a mode on welfare, requiring government force to keep it viable. Eliminate the forced recruitment of the speed tests, and amateurs would likely choose other, better, non-voice methods. Though no doubt a few would continue to learn Morse simply for nostalgia value, just as some still use AM.

>Others have spoken of the spectral efficiency, data throughput, etc. This all
>assumes that maximum throughput per channel is what is important. I don't
>believe this is so. It is (IMO) number of people per band that is more important.

Then push for *low speed* Morse. :-) At one dot per hour (Farnsworth), we could put a *lot* more people on the air. But how effectively would they communicate? If it is nothing else, amateur radio is about communication by radio. The more quickly and naturally one can communicate content, the better. Thus throughput matters (unless you have nothing to communicate).

>Besides, what is the spectral efficiency of a voice channel that consumes 3KHz
>(ideally)?

One useful measure of spectral efficiency is information content per unit bandwidth per minute. Normal speech is 120 WPM (except for some Southerners and Southerner wannabes). SSB speech fits in a 200 Hz-2.1 kHz bandwidth, so it has a "Q" of 120/1900=0.063. 20 WPM Morse with standard 5 mS shaping fits in a 400 Hz bandwidth, so it has a Q of 0.05, less than SSB. Now Clover fits in a 500 Hz bandwidth and has a speed equivalent to 480 WPM, so its Q is 0.96. Which one do you think is more spectrally efficient? Which is the least spectrally efficient?

Note: You can copy Morse with a narrower filter than 400 Hz, but you are clipping off part of the transmitted signal when you do. That signal still spills over onto other users within +/- 200 Hz of the

carrier. That's inherent due to the sidebands generated by the
keying shaping. Use square shaping and the key clicks spread over
tens of kilohertz (theoretically over an infinite bandwidth) causing
interference to other users.

>Why would anyone care if someone cannot saturate their 300Hz slice with maximum
>data throughput because they can work at only 5 WPM Morse? Are they to have
>time limits imposed, forcing them to speed?

You are the one wanting the most people to be able to use HF. Frequency
division multiplexing isn't the only way. Time division multiplexing
frees spectrum too. The quicker content is passed, the quicker other
people can reuse the same spectrum for their contacts.

>Is everyone to use some digital mode,
>and in order to maintain maximum data throughput on the "channel", everyone
>is to be connected to concentrators? Of course not.

Why "of course not"? If suitable "concentrators" can be developed, why
not use them? One such "concentrator" (poorly implemented at present)
is packet. It allows many users to share a single channel. Granted, HF
packet, as presently done, is a poor joke, but that's an implementation
issue, and not inherent to the concentrator technique. A DAMA protocol,
and a better modulation encoding, could do wonders for HF packet.

>Spectral efficiency, Shannon, Nyquist, sampling and signal theory aside, ten CW
>operators could fit into the space of one phone operator. On HW, this is, I believe,
>important.

1900/400=4.75 (call it 5 since fractional operators aren't allowed). But
5*20 is only 100 WPM, not as good as the SSB operator's 120 WPM. It'll
take each of those 5 CW operators 6 times as long to say the same thing
as the SSB operator, so 6 SSB operators could speak in the time taken
for the CW operators to "speak". 6/5=1.2 advantage for a SSB roundtable,
an informal form of TDMA which works quite well.

>A rhetorical question to those who say they wouldn't use Morse, thus it's a waste of

>believe the tech components should be strengthened. I haven't written a Ham
>exam yet, so no-one can accuse me of trying to create an exclusive club of which
>I just happen to be a member.

The government has a legitimate interest in amateurs operating clean
transmitters, because dirty transmitters can cause harm to others, in
and out of the amateur service bands. Since amateur transmitters, even

the store bought ones, are not Type Accepted, the government depends on the amateur's technical knowledge to keep them in compliance. That's why there is a technical test. The government could require all amateur transmitters be Type Accepted, and then like in other services with Type Accepted equipment, such as land mobile, the government wouldn't have a compelling need to require a technical test. However, that would sorely impact the experimenter (one of the main reasons for the amateur service), so a technical test is required.

There is no similar compelling government interest requiring continued Morse speed testing. There is no evidence that harm has been done by slow Morse usage, or even by no Morse usage. It is merely one of several text encodings (and not the best) that an amateur may choose to use, or choose not to use.

It is important to realize that even among those who know code, some (about half of those on HF) operate no code. At all. Ever. (And many of them couldn't pass a Morse speed test for their license class today if their lives depended on it.) Yet I would suggest that is not of legitimate concern to the goverment. Those de facto no coders harm no one's interests but their own (if that), and that's their business, not the government's.

Having Big Brother insist we "eat our Morsies because they're good for us" is an illegitimate abuse of government power, especially since the government does not insist that we *continue* to "eat our Morsies" after we pass their test. If the government did insist we spend 50% of our HF time operating Morse, then no test would be required since we'd have to learn Morse anyway to comply with the usage edict, and formal testing would thus be redundant. So use it or don't use it, a formal Morse speed test is either redundant or irrelevant.

> >'do not know code' then you're correct; if it means 'never passed 1A/1B/1C',
> >which is a reasonable reading, you're incorrect.

This "Scummy No-Code-Tech" actually did once pass a code test -- I wish I'd hauled a** down to the FCC to pass theirs after passing the Boy Scout's 5wpm test 30-odd years ago; if I had, I'd be QCWA instead of N1VUX.

I suppose I could do it again. I just find it as silly as wig-wag semaphore. Now that I've found a Farnsworth program that runs on the HP48, I may just do it...

Just remember, No-Code-Tech's are licensed to commit morse-code CW emissions from from 50MHz to Daylight, no test required. Which includes the 6m DX band. And includes the current open challenge, the 2m trans-Atlantic. And includes the EME WS work. (Heck, there's even been one morse-code QSO above daylight: two guys got about as much range with Gamma rays (modulated with lead shutters and decoded with Geiger-counters or some such) as the club's two 1.2Gig guys are expecting to get, albeit FM voice.) We're allowed to use the code, we're not certified code free, we've just passed a code-free test.

I think we might as well test for damped wave theory as ability to send or receive hand-keyed morse-encoded CW emissions. (Or Farnsworth-encoded if from an ARRL VEC.) The technical and regulatory components of the exams should be the real limiting filter, the real challenge. Just removing the misnamed "CW " test would be wrong; but not changing the current exam structure is equally wrong. I'm embarrassed by how easily I passed the Tech exam (the novice exam should be easy) and how close I got to passing the General written exam w/o additional study (it being 15 years since physics class). The guys who complain that the current no-code-tech ticket is a worthless piece of paper are perhaps right, but it is not the lack of a CW test that makes it so... its a test after the fashion of our public schools, sigh. Well, we're working on our local public school. Maybe we can make the tests tougher too. The idea that the 20wpm is the hard part of getting Amateur Extra is absurd. I hear tell that back in the good old days you had to actually know some electronics, be able to design an oscillator, to get a General ticket. hey, I'd like to learn that. I'm a little scared that I'm licensed to repair and build transmitters without being

tested on that! (Although I understand it's the oscillator you didn't
intend to build that causes the most trouble...)

What are we to do? Put some theory back in the "theory" exams.
Then remove the obsolete CW requirement from WRC-97 and FCC regs.
And add some real technological demonstration to the FCC exams per
existing treaty requirements.

My prior comments on the exam structure and Len Winkler's
Written-Only-General proposal are at http://world.std.com/~wdr/phil.html

From: Thor Wiegman <thorw@nidlink.com>
Message-ID: <01bb5fe3.b58926e0$1d4960ce@thorw.nidlink.com>
Source record: 36324

Let's see....my interest is to run AMTOR on the HF bands. I have to pass a test of my skill in CW. There is no test of my knowledge or skill using AMTOR....I might not have a clue how to legally use that mode, but by god if I can operate CW then I'm your boy and I can just have at it.

What about SSB? How many times have you heard people using ten codes, talking too close to the band edges so part of their signal goes out of band, folks with imporperly tuned transmitters or hyperactive voice processors? But hey, they can handle 13 wpm code so they must know how to operate SSB right? (and FM, SSTV, and all the other wonderful modes)

So, IMHO, the code test seems a bit stupid for those of us who have no intention of EVER operating that mode. If you want to run that mode then more power too you (so to speak) and I think that you should be tested to see if you know how to do it properly. But I would like to weed out some of the undesirable SSB ops with a test on that mode. And I would love to operate HF SSB but since I don't care a pair of dingo's kidneys about CW, I don't bother to take a test on that mode. Nothing personal against CW ops but CW bores me about like tinkering with high speed digital microwave bores most of them. (note I said most not all).

I think our testing methods should be changed to cover general theory and rules with a bit of general operation stuff on an assortment of the popular modes. But we should issue licenses for the mode of operations, not for frequency groups.

Here's something to think about: If I had an Advanced class license I could study real hard and get the Extra. That would mean taking the 20 wpm code too. What does that gain me? All that gives me is another chunk of frequencies right? Whoa cool....until you realize that the only other people to talk to on those frequencies are Extras. Something just doesn't seem right about that.

Just my view on it....what do you think?

American Extras yes. But you could also talk to many others like us
Canadians here who only had to do 12 wpm CW to get those frequency
privileges. If nothing else, you Yanks have to come up with a much
less complicated testing system. You should be allowed full band
privileges just for understanding them!!

Not a chance. Too progressive for this hobby! Here's another
progressive idea that would never fly. Instead of a 5 wpm CW
test to get you digital privileges, how about an actual test that
is strictly about digital - ie knowledge and operation of the
various digital modes. I know, it's just to sensible to ever
be accepted.

3233. HF Protocol Comparison

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-22 00:00:00 UTC
From: "Robert W. Lewis" <rlewis@staffnet.com>
Message-ID: <31CC879B.49F4@staffnet.com>
Source record: 36202

See July 1996 QST Page 35 "A Comparison of HF Digital Protocols". Very interesting results! If you look at table 1 and "solve for the unknown" you realize that the modems are as follows:

A = SCS PTC-II
B = AEA (probably a PK-232)
C = HAL (probably a PCI-4000)
D = Kantronics KAM

Of particular interest is the fact that at low SNRs, modem A had nearly twice the throughput as modem B on Pactor-I. This seems to take the mistery out of the value of the analog memory ARQ using an analog to digital converter - something SCS and Paccomm have been saying for a long time.

In this post, I may be rehashing some of my earlier points, but the discussions preceeding this may have brought them more into focus (for me, at least).

There seem to be two sub-threads running through this whole thing, namely one questioning the need to mandate Morse and one wanting to make Morse obselete.

While I am as much against government interference as the next guy, I have a hard time objecting to the requirement to learn something that is easy and has been useful in the past (and is still useful, IMO, for the reasons given below). Again, I must point out, it takes more time for me to respond to these posts than it does to do a Morse drill.

Gary's own arithmetic points out that Morse is more or less equivalent to SSB phone in spectral efficiency (while both are much less efficient than his various digital modes). But here's the rub, more people in the world are able to communicate with you via Morse than with any other mode, phone included. It is the simplest mode and brings into the realm of contact possibilities many more foreigners than any other mode for the following reasons:

- As Gary has mentioned already, digital modes come and go (re RTTY). What is today's hottest mode may be tomorrow's obsolete trash. Morse, on the other hand, is everywhere on HF and has been there for a long time. Thus, there is quite a world wide investment in the necessary equipment. While we might be able to afford to go out and buy the latest TNC or equivalent and upgrade with the latest software three times a year, elsewhere in the world the poor Ham has a hard time being able to afford even a simple CW TX.

- If a digital mode is not an option (ie, the other guy can do only phone or Morse), Morse cuts through more easily than phone.

- Being able to read and write a foreign language is one thing, being able to speak it is another thing entirely (those who are bilingual have a good understanding of this). Apparently, it is very hard to learn to speak English, as it has no solid phonetic rules (or too many!!!).

If you're not interested in talking to foreigners, then why do you need HF, when you can use repeaters and Oscars and TNC's and PC's for all the local and national coverage?

In my book, there is another advantage to CW. It is:

- For the home brewer, tackling a CW TX is a much simpler entry point. If Morse were to disappear, how many adults (let alone kids) would even try to start building a digital based TX or RX? OK, maybe they can build just the RF part, but you still need the interface box and a computer for the rest of it. You're not up and running once the carrier goes out, you have the usual PC quirks, interface problems, software problems, etc. Besides, the project went from one with a large percentage of it being home grown to one where the constructor's effort is little more than a tack-on.

Anyway, hearing that faint Morse code coming out of the static and decoding it manually is infinitely more exciting than just reading text on the screen. I can see it now, "look son, there's a message on my screen!". The kid looks and says, "so, why's that different to all the other messages on your screen?" It's just not the same (my day job is development of OS modules, device drivers, microcontrollers and firmware, so maybe I'm a little jaded on digital modes).

Already, with the loss of Heathkit (of old), etc. there seems to be a dearth of kids trying to build things themselves (I have my pet theories for why this is so, but that's another subject entirely). Anything that discourages the remainder (and adults as well) is, IMO, counter-productive to the aim of advancing the art. Everyone needs to learn to walk before they run. They still stick a pencil in the hand of the child and show him how to write the alphabet. They still give the child fingerpaints and a piece of paper. Giving them Microsoft Word and Adobe Photoshop at the start will result in nothing.

Do you give your child (or beginning adult) the parts to make a crystal or one transistor AM radio for his/her first project, or do you give the child a kit for a digital PLL FM receiver?

A one tube CW TX with about 18 components (plus another 6 or so for the PSU) will get you up and running with 50 Watts on 40M and 80M. (just what I plan to build once I have the license). What would be the parts count and logistics attached to doing the same thing using one of the digital modes?

IMO, A person building the simplest device from scratch learns far more, has deeper insight and enjoys it much more than someone buying the most complicated device. So let's not discourage them by by making the simple modes obselete. How many times is it that the person starting with that simple shoestring device goes on to create something truly groundbreaking later? However, I'm wandering off topic at this point.

Should these reasons be enough for the government to mandate Morse? Perhaps not. But it is easy and, for foreign communication, useful or necessary. So why not learn it? Like someone else said, the real techs he knows just knuckle down and learn Morse, so they can get on with it. It'll take more effort to eradicate it than it will to

learn it. And if you do eradicate the Morse requirement instead of learning it, what will you have achieved?

So yes, despite on person's snide remark to the contrary, I believe learning Morse will broaden the mind in one way or another.

Tear me up all you like from here, I'm won't repond to this thread anymore - I have a CW TX design on which to work.

Cheers,

Chris.

3236. Have PK-232(noMBX) Is there a Windows pgm on the net available?

Looking for a program (beta OK) that I can run under WFW 3.11 that is equivalent to AEA's PC Pakratt for Windows.

Don't need any special bells or whistle's, but hate launching a DOS window to make PCPakratt for DOS run.

Just curious what others have found that works well and has a nice GUI look/feel.

73's de WA6SUY Chris, SF Bay Area.

Give WinPack a try, it's free. BUT - make sure you get the PK-232 out of
host mode first! (95 percent of TNC "problems" with WinPack have been as
a result of people trying to use it with PK-232s that are stuck in host
mode as a result of using Pakratt.)

You can find the latest version at ftp.demon.co.uk. The file is
pub/ham/winpack/winp553.zip. It is also available in the Hamnet forum
library on Compuserve.

p.illmayer@sno.mts.dec.com (Peter Illmayer) wrote:

>They stand behind their laws and bellow "Encrypted messages are not
>allowed on the packet network".

The International Radio Regulation, Article 32, section 1, §2 says
among other things: ".... they shall be made in plain language and
shall be limited to messages of a technical nature ..."

This was a major problem when allowing digital communications at all
on the amateur frequencies. Packet is not plain language. But, the
administrations in the different countries accepted that commonly
known codes could be used. This way they could allow BAUDOT, ASCII,
AMTOR, PACKET, PACTOR and commonly known algorithms like .ZIP, 7+,
FBB compressed forward etc.

However, hidden information of any kind is not accepted by the
regulations. And we don't want to violate the international
regulations, do we ?

The use of PGP is a strong effort to make the information unavailable
for others, and thereby violates §2.

There might be a difference if You sent the private key together with
the encrypted message. That way You could conduct Your experiments
with PGP.

>2) I want your colaboration ?
>3) Want a 144mhz sked ?

>This utter trash wastes the bandwidth of many digital resources but it
>goes on day in, day out.

This is a big challenge. The packet system should be open for all
hams. But, like the Internet, the bandwith is filled up at any time.

Would You like some more restrictions on sending bulletins? Like
limiting the access to sending bulletins? Or limiting the message

size?
Some BBS's queue up the messages for forwarding. Private mail first,
then small bulletins and at last the large bulletins, if capacity
allows it. Is this OK?

>than likely be a General class or above than a Codeless tech.

This doesn't appear to be true. While the FCC has finally cracked down on one notorious HF amateur (by denying his license renewal based on an unrelated phone phreaking conviction), most of the NALs in recent times have gone for misbehavior at VHF or above. One recent case was an Extra jamming McDonalds communications in Texas and another infamous case was an Extra jamming HBO's satellite feed (remember that?). OTOH, the recent protracted jamming war on 3995 kHz, which generated a petition for rulemaking, resulted in no NALs issued by the FCC.

It would appear that the FCC does little policing of amateur band activity at all, but usually acts only when other services are affected. With the closure of the HF monitoring stations around the country, the FCC has little ability to monitor HF (and apparently an even smaller interest in doing so). The few remaining enforcement vans are used mainly for VHF and above DFing. And they roll only in cases where other services, including interfering with air traffic control in one recent case, are affected.

Many years ago, the FCC was a bit more diligent in patroling HF. In 1964 I got a notice (a warning) for running a rough note on 40m (I was running raw AC to the plates of a pair of 211s in push pull). But that hardly ever happens today. The FCC could write a thousand NALs an hour just by monitoring 75m any evening today (or 20m during any Dx contest), but they don't. The FCC concerns itself mainly with policing the more valuable spectrum above HF, and usually only then when it receives complaints from other services. And it is still the Morse speed tested amateur who garners the lion's share of the notices issued.

There is some statistical reason for that, there are still more Morse speed tested amateurs, even at VHF and above, than there are code test free amateurs. However, the burden of NALs does fall disproportionately on the Extra Class, and they are still the smallest amateur class. Perhaps Morse speed testing selects preferentially for a certain personality type which is prone to anti-social behavior. Or perhaps Morse speed tested amateurs are just more active and hence more apt to be noticed. Whatever the reason, they do get most of the NALs, and today most of those NALs aren't for HF operation.

Gary

Oh dear - like so many others you are confusing PGP encryption with PGP digital signatures.

I don't think anybody is suggesting that PGP encryption should be allowed. A digital signature is simply a means of message authentication.

I am prepared to attach a PGP digital signature to my packet messages that says "this message originated from G4IDE". It will also protect the contents of the message against alteration along its route, in that, if anyone alters the message, the presence of the signature will make it possible to show that alteration has occurred. In this way I am prepared to take responsibility for the contents of my packet messages.

New regulations about to be introduced in the UK will require *every* sysop to run a filter on *every* message that passes through his BBS looking for "naughty" words. What a nonsense! PGP signatures allow responsibility for message content to be put firmly with the originator, not with the BBS sysop. They aid the management of the network, they don't impede it.

Greetings,

You want to run AMTOR, etc.. a digital mode! Here's what I think:

Perhaps the NOVICE portions of 10, 15, 40, and 80Mtrs should be
allowed to have not only CW, but digital operations. Passing a
CW test at 5 wpm for digital priviledges (limited to 250w in the
Novice band) means any TECH-PLUS licensee could get a taste of
RTTY- Amtor - PACTOR - CLOVER - etc....

Comments???

Hi Thor:

What you are thinking makes sense to me. Its hard to believe that we are so far behind the technology curve when just 30 years ago, we lead and made the curve.

I guess it should come as no real suprise that a cluster of technically lame communicators would use technically lame testing methods to determine whether you could join them or not.

We even seem to have difficulty defending our very existence and are losing frequencies all the time.

Hopefully new blood in our hobby will address this stuff in some neat way. Public relations for amateur radio is needed for our selves to give us a better mirror to where we take this hobby/service/experience beyond the year 2000.

The evidence doesn't really support this. In most foreign countries, including those "rare" ones considered exotic Dx, any indigenious amateurs are very likely to be among the wealthy elites of the population, and very likely to own the latest Japanese equipment. For the poor of those countries, any form of amateur radio is simply not an option (for one thing they are unlikely to have the "connections" to get a license). For people living on $200 a year, there are more pressing needs than operating amateur radio.

Examine the pictures of foreign Dxer's shacks in QST or CQ. Most often they are very well equipped. And having been involved in the sales of the 56 kb RF modems, I can tell you that foreign sales have exceeded domestic sales. That tells me two things, foreign amateurs seem to have a greater interest in advanced technology than the much larger US market, and foreign amateurs can find the money to buy it. My on the air HF digital activity tends to confirm this. I've contacted over 200 countries on digital modes (real countries, not Dx rocks). If amateurs in those countries can't afford digital equipment, they sure do a convincing job of faking it.

This picture of the foreign amateur as being both poor and too stupid to do better than CW isn't very attractive. Some foreign amateurs may indeed be poor by our standards, but the ones I've contacted have also shown themselves to be quite resourceful. In particular, I've contacted

an Indonesian amateur who built his entire HF digital station from PTT castoffs. And I've worked an English milkmaid whose Oscar station is entirely homemade (England may not normally be considered a poor third world country, but a farmhand doesn't make much money by our standards.)

>- If a digital mode is not an option (ie, the other guy can do only

True. But there are already more amateurs than you can contact in a lifetime who aren't in this situation.

>- Being able to read and write a foreign language is one thing, being
> able to speak it is another thing entirely (those who are bilingual
> have a good understanding of this). Apparently, it is very hard to
> learn to speak English, as it has no solid phonetic rules (or too
> many!!!).

True. That's a reason why text modes are better than voice. But *any* text mode will do, it doesn't have to be Morse. However, for the stylized contacts of many Dxers, the spoken English required is so limited that it poses much less of a problem for the non-English speaker than learning Morse *and* learning the stylized English phrases needed to be sent by Morse.

For those *with something to say*, knowledge of a common language is still required regardless of the mode used. English is the most common language used because the majority of the world's amateurs speak it as their first or second language, but Spanish, French, German, Japanese, and Russian are also common languages used on the radio. How many do you speak? I speak two of the above, and can get by in another. US amateurs would be better served increasing their language skills rather than concentrating on a text encoding method.

>If you're not interested in talking to foreigners, then why do you need
>HF, when you can use repeaters and Oscars and TNC's and PC's for
>all the local and national coverage?

To be blunt, you can't use those methods very effectively for continental coverage as yet. HF digital allows long haul relay that isn't practical with the sparse VHF terrestrial networks, and which isn't yet well served by satellite relay. Besides, HF is an interesting propagation medium with characteristics not found on VHF or UHF. It presents a different set of challenges to the modem and protocol designer than the primarily white noise environment of VHF/UHF.

>In my book, there is another advantage to CW. It is:
>
>- For the home brewer, tackling a CW TX is a much simpler entry point.
> If Morse were to disappear, how many adults (let alone kids) would
> even try to start building a digital based TX or RX? OK, maybe they
> can build just the RF part, but you still need the interface box and a
> computer for the rest of it.

And you need a few billion conditioned neurons for Morse. Ok, the neurons are homegrown, but the programing complexity is several orders of magnitude greater than even the most complex DSP TU. At least you *can* understand a hardware modem. To date, even the top neuroscientists don't understand the workings of the wetware modem.

>Anyway, hearing that faint Morse code coming out of the static and
>decoding it manually is infinitely more exciting than just reading text on
>the screen.

For *you*. That's not universally the case. To me, the excitement of seeing text spill forth on the screen from a signal too faint to hear is infinitely more satisfying. That's particularly so because it was my creation that was able to do it. Every time one of my digital designs works, I'm like the proud pappa watching his kid take his first steps.

Is naked eye astronomy more exciting than working with the Hubble Space Telescope? I don't think so. Tools amplify your capabilities, and good tools amplify them even more.

>Already, with the loss of Heathkit (of old), etc. there seems to be a
>dearth of kids trying to build things themselves (I have my pet theories
>for why this is so, but that's another subject entirely). Anything that
>discourages the remainder (and adults as well) is, IMO, counter-
>productive to the aim of advancing the art. Everyone needs to learn
>to walk before they run. They still stick a pencil in the hand of the
>child and show him how to write the alphabet. They still give the
>child fingerpaints and a piece of paper. Giving them Microsoft Word
>and Adobe Photoshop at the start will result in nothing.

Are you *sure* about that? Even now some kids are learning to type before they learn to write manually, and even now kids are using PC paint programs (and saving their parents from having to scrub crayon scrawls off the walls). In times past, a kid would be handed a hammer and chisel and pointed toward a rock in order to write, but times change, methods change, and I think mostly for the better.

>Do you give your child (or beginning adult) the parts to make a
>crystal or one transistor AM radio for his/her first project, or do you
>give the child a kit for a digital PLL FM receiver?

Such a FM receiver is only two chips today, hardly more complex than the AM radio from the constructor's point of view. But a crystal set or a one transistor AM radio still works as a teaching aid *because it doesn't require an artificial text encoding to be learned first* in order to be used. That makes it a better introduction because the child or beginning adult can concentrate on the *radio* aspect without simultaneously having to be concerned about rote conditioning to decipher an arcane encoding.

>A one tube CW TX with about 18 components (plus another 6 or so
>for the PSU) will get you up and running with 50 Watts on 40M and 80M.
>(just what I plan to build once I have the license). What would be the
>parts count and logistics attached to doing the same thing using one

>of the digital modes?

You forgot to include the billion neuron wetware modem whose workings
you don't even begin to understand. Contrasted to that, a box with
a few chips in it is simplicity itself. You might not know how it
works now, but at least you *can* learn how it works. You *can*
develop algorithms to improve its action based soundly on information
theory rather than hit or miss thrashing in the dark trying to improve
the unknown workings of the wetware modem. And you can communicate
your improvements to others, who can easily duplicate your work since
the behavior of hardware is predictable while the behavior of wetware
continues to be wildly variable.

Good tangible hardware is understandable, and much easier to deal
with than squishy wetware with uncertain wiring and poorly understood
components with uncertain specifications. The former is engineering,
the latter is voodoo, witchcraft, and snake dancing.

: if I can operate CW then I'm your boy and I can just have at it.
Ah yes , AmTOR

But when you first discovered radio , which mode did you find out about
first ?

The CW Test is the best thing guarding OUR HAM BANDS.

It means that only those who WANT access MUST do MORSE.

THAT WAY - WE ALL KNOW HOW "YOU" ARRIVED.

If the rules are 'bent' then access rules will be eventually
eroded to a point where anyone will get access.
The end result is that YOU AND ME , the small individual
will be pushed out and OFF.

RIGHT NOW _ IF YOU WANT HF YOU MUST LEARN AND PASS MORSE TEST.

If the moves planned for WARC go thru the access rules will be
watered down and the HF access rules will be changed so that
'others' will arrive via the " either xxx or yyyy " new rule.

And result will be your precious AMTOR BAND will disappear.

REMEMBER HF IS GLOBAL.

>other states too. I'm glad it worked in your area though.

Well, thanks, Ron, but we didn't get where we are easily or in
short order. It took 15 years of constant effort. It's easy to
get discouraged and quit. We didn't quit, even when we were mightily
discouraged, we just kept pushing until we succeeded. We were
fortunate to have some pioneers whose enthusiasm and determination
were boundless, and whose energy was incredible. That made it
easier for those of us just plugging along. But it was that constant
plugging which did the job.

You can't move mountains with a single shove, it takes years of
effort by lots of people chipping away to do the job. I know it
is hard to do that when at the end of the day the pile of chips
you've made looks so tiny, but it adds up eventually.

Note that we're still not in digital nirvana down here. We still
have lots of problems (which we view as challenges). Our job is
not done, not by a long shot, but when we look back at where we
were 15 years ago, we've come a long long way.

We still need to move more of our users off 1200 baud (I'd love
it if manufacturers would quit including those infernal Bell 202
modems in their TNCs, and if new users would quit assuming that
a HT is the perfect packet radio). We still need to expand the
network further and make it faster. We need to look at alternatives

to BBSs to move bulletins (we're thinking about a broadcast server), etc. There's lots more to be done. And it all seems to happen *so* slowly. But like the constant drip drip drip of water hitting a stone, we'll eventually create a Grand Canyon.

The thought of giving up just never occurs to us. We're a stubborn bunch down here. :-)

True. A stone axe still works in a world of chain saws. It just doesn't
work as well. It is only our insistence on demanding the universal mastery
of the knapping of a stone axe before allowing use of the chain saw which
makes us seem anachronistic.

Hi Cliff,

For AMTOR, check out:

MYALTCAL - Alternate AMTOR SELCAL

I've not set it up on the bench, however the PK-232 >may< respond to
both the MYCALL and MYPTCALL callsigns if one is set to your former
call, and the other is set to your new call. Worth a try!

Roger,

I've just downloaded and installed WinPack 5.53 from Demon. It looks
very good and I'm hoping to replace Paket6.1 with it, but I think Chris
might be looking for a multi-mode package for the PK232. Of course
WinPack or Paket will do this fine, either by entering the commands
longhand or from macros, but I think PC Pakratt is a Host mode program,
at least my non-Windows version is! Thanks for the advice on the start-
up problems, I'll watch out for that.

Gary,

Are you comparing the stone axe to Morse code and the chain saw to modern modes of communications? If so, I believe a better analogy might be a more modern metal axe with wooden handle and the chain saw. I suspect that there are many people who own both a chain saw and an axe, and depending on the job that needs to be done, the chain saw and/or the axe might be selected. Which tool would work better if you ran out of fuel?

Certainly, Morse code is the oldest mode of electrical/electronic communicatons. But there will always be a place for it among the more modern modes of communicatons, simply because it works when others fail, whether its electronic or not. For example, I learned from a TV documentary on the Vietnam War that one of our pilots who was being held captive sent Morse code to the US during a propaganda video taping. How did he do it? By blinking his eyes! Other folks could probably come up with other examples where code was used when other means of communcations would have been impossible or impractical.

Best regards,
Lindsay

You don't seem to understand the history of this issue. Look back at
who pushed the code test free license. It was not the manufacturers.
It was not the magazines (except for 73, and poor Wayne just declared
bankruptcy so he didn't profit from this). It was thanks to the efforts
of the QCWA (you know, those *old* hams), TAPR, AMSAT, and a number of
progressive individuals, none of whom were associated with the radio
manufacturers.

Those groups didn't push for change because they thought it would
profit the radio manufacturers (though of course they realized that it
would), but because they thought it was best for the long term interests
of amateur radio to have a vigorous, forward looking, and growing service
(rather than one which was greying at an alarming rate), and one more
interested in future possibilities than in past methods.

We got the vigorous growth we expected. We attracted some forward
looking people (and some chaff too of course). Several aspects
of amateur radio were invigorated (particularly the club scene,
which was in dismal shape in some quarters before the change).
And the greying trend has been reversed. Those things all bode
well for the future of amateur radio.

Code test free HF is in some ways a different matter. There is
no perceived need for vastly increased numbers of HF users. We
really don't care much if this subset of amateur radio is greying
since it occupies only a minority of our spectrum. And while it
would be interesting and useful to pursue new methods on HF, there
is no overwhelming need to do so, and the small numbers of code
speed tested amateurs who are inclined to do so now are sufficient
to do the pioneering work.

The issues with this reform movement are different. This is more
a matter of structural change, to undo the harm of Incentive
Licensing, to align test requirements with privileges granted,
and to address genuine government concerns rather than fallacious

claims such as Morse testing is a lid filter.

Whlie we can't be sure what effect such changes would have on HF numbers, other constraints are likely to limit the impact more than some have suggested. For starters, some of us advocate a rather substantial reform of the written exam to more directly address legitimate government concerns than the present ones do. This may limit HF growth.

And the realities of HF require amateurs have the ability to erect substantial antennas. What with antenna restrictions and apartment living, this will serve as a limiting factor on the number of active HF amateurs. Buying and using a HT is one thing for the apartment dweller, setting up an effective HF station is something altogether different.

Cost of HF equipment for those wishing to effectively use HF is also a factor. Though for those who build, or who choose to use modern digital methods, or even primitive digital methods, IE Morse, limited antennas and power won't be much of a limitation, but then such operation won't present much of a problem either. And there certainly won't be any complaints about Morse from those who voluntarily choose to use it.

In any event, there would certainly likely be some increase in active HF operation, which would, of course, generate some equipment sales. That's not a bad thing in itself, and can serve to keep the amateur industry healthy and providing more and better equipment choices for the rest of us. Moreover, more crowding is not altogether a bad thing either. It is that sort of pressure which led to the widespread adoption of more efficient methods and techniques in the past, IE the switch from spark to CW, AM to SSB (and indirectly to the rise of modern digital techniques). One such promising direction might be a move to spread spectrum. That has the potential to more efficiently use our HF allocations, but there's little real need to adopt it now with our current limited numbers. A rise in HF users might drive that technology to widespread adoption.

I think that the structural reform is a good thing, whether it results in any other benefits or not. I think it is important enough that even some discomfort might be worth the cost. The present licensing system is badly broken (in a real sense it is illegitimate) and needs repair. When laws are perceived to be irrational, respect for law (of all sorts) declines.

Gary

We seem to be using the term "link" in different senses. I'm using
it in the generic sense of an opened communications channel, IE a
contact. ACSSB could be used for a repeater link I suppose, but
remember that it isn't FM so there is no noise immunity due to
limiting and capture. It could get very active during a thunderstorm.

I was interested to read the article also seeing how I am just getting into digital hf with a Kam+ to use with my Kenwood TS850. From what I can tell GTOR looks like a great mode that is available in a affordable tnc. I understan it is unique to Kam+ though. I have not been able to monitor anyone using GTOR though. Does anyone know of particular frequencies that GTOR users might frequent? Thanks. --- Steve N9ROU

>that there are many people who own both a chain saw and an axe, and
>depending on the job that needs to be done, the chain saw and/or the axe
>might be selected. Which tool would work better if you ran out of fuel?

No, I meant stone axe. You buy a modern steel axe off the rack at the
corner hardware store just the same as you do the chainsaw, but you
have to knap your own stone axe, and that's an appropriate analogy to
Morse. You have to knap your own modem out of wetware. You get to take
no advantage of the leverage of modern technology or division of labor
or engineering experience, you have to fall back to the level of Og
the caveman.

A modern steel axe or a chainsaw are the products of generations of
engineering refinement and knowledge, the result of the efforts of
hundreds or thousands of people backed by the power of the industrial
age. But conditioning a wetware modem isn't. You don't get to expand
your reach by standing on the shoulders of giants. Rather, you are
reduced to the level of the stone age flint chipper in producing
your tool. So it is no surprise that it isn't a very keen tool.

And it is a brittle tool as well, subject to failure points you
don't even understand because you have no understanding of its internal
stresses and weaknesses. You haven't been producing and field testing
that model of stone axe for decades. It's your very first one, just
like Og's stone axe was his first one. You can't pull down your
trusty copy of Machinery's Handbook and read out the specifications
of the material you are using, it is just the piece of rock you happen
to have between your ears. Its cleavage planes aren't exactly like anyone
else's, so you can't use their experiences as a trustworthy guide.
You have to proceed by guess and by feel and hope the result won't

shatter against the first knot you encounter.

>Those of you signing your mail will be found [Easily!! Because
>you signed it!!!] and be prosecuted!"

Think about it. They cannot legislate any form of non-repudiation when people sign their call on any of the non-digital modes. The new regime (assuming a secure centralized key repository) would mean it could be *proved* that a specific licensee was violating a rule. This would remove one of the excuses for non-enforcement of the regulations. This would mean they would actually have to *do* something when a complaint was raised.

FYI - when the VE7TCP ampr/internet e-mail comes back to life, it will *require* PGP signatures on any mail passing through it.

Good idea! Morse is after all the original digital mode. Samuel was a
very clever person and I'm sure he would never have expected his
invention to be cast in stone, either as a mode or as a qualification
for a licence. We've moved on in our hobby from spark transmitters, so
why can't we move on from Morse?

If we had a digital modes test, those who like doing it the hard way
could perhaps opt for decoding 45.45 baud RTTY by ear?

3263. Proof ham radio is dying

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-23 00:00:00 UTC
From: Burt Fisher <k1oik@ccsnet.com>
Message-ID: <31CD1502.2095@ccsnet.com>
Source record: 36209
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

Kenwood and Microsoft agree ham radio is dying.
(but I told you that a long time ago)

KENWOOD DEFENDS DISTRIBUTION PLANS

Kenwood Communications Corp says its recently announced plans to make its products available in more retail outlets will help to rejuvenate ham radio. Citing concerns about the future of Amateur Radio and a changing business climate, Kenwood announced it was taking "some bold steps" to revamp its wholesale distribution scheme.

In a June 10 open letter to the Amateur Radio community, Kenwood's Amateur Radio Products Group National Sales Manager Paul Middleton, KD6NUH, painted a dismal picture. "When we looked at where Amateur Radio is today, and where it is going to be in ten years at the present rate of decline, the future looks bleak," he wrote, citing competition from unlicensed communications modes. (internet).

"It is also obvious that the rate of no-code licensees is slowing down with fewer and fewer people upgrading," Middleton wrote. "Amateur Radio dealers should be more interested in attracting new people to our hobby. Every current amateur operator who wants this hobby to continue should be promoting ham radio to non-hams."

* Microsoft Network (MSN) has dropped its Amateur Radio Forum, reports the unofficial forum manager Rick McMillion, WB7UGZ. He said MSN gave him the word recently in a terse e-mail message. McMillion says he had no warning that MSN was going to dump the forum.

This this is fragmented over several available versions of digital operation.
CW is still much more universal, which is why there is resistance to getting
away from it as the prefered "digital" method of emergency operating
on HF. Which is also probably why this particular group is still opposed
to removal of morse testing.

Throughputs range from 6 to 40
> char/sec, or roughly 72 to 480 WPM, well above the capabilities of
> Morse users. And they can operate at CNRs where most Morse users give
> up. Perhaps for casual operation. Where the message has some importance,
the operator will hang right in there. Actually, I don't know that
it has actually ever been quantified as to how tough the situation has
to be before an experienced operator will give up. It would be
interesting to know.

While voice, at 120 WPM, is faster than Morse, some of the newer
> digital methods put voice operation to shame while consuming considerably
> less bandwidth.

This is quite true. PACTOR II is one of the latest and very best examples.
But again, how wide-spread will it's usage be? How long before something
else comes along that is newer-bigger-better? This is where some of the
Morse testing proponents can make a good point. Morse is fully developed
and will not see further evolution - again, we are getting back to the
emergency operations senario. And yes, I know that actual CW usage during
the aftermath of a disaater isn't the major mode - especially in the
affected area, where VHF (and up) FM voice rules the roost.

Truth is, packet would be a much better way to go, but, not
everybody has packet equipment yet. Further, many more do not have
a portable set-up. We are currently facing this dilema here in my area.
We want to implement some sort of packet program
into our emergency plan, but have to admit that there aren't enough
local hams with portable packet stations. So, FM voice, wins again
by default. Some day though. . . . .

If Morse is on welfare, it is our own doing. The mode will percieved by the
image we project for it. And while there are those who may learn it for
nostalgia. In my experience, when properly presented, Morse is then something
that is WANTED. It also makes the learning process much easier.

> One useful measure of spectral efficiency is information content per unit

> Clover fits in a 500 Hz bandwidth and has a speed equivalent to 480 WPM,
> so its Q is 0.96. Which one do you think is more spectrally efficient?
> Which is the least spectrally efficient?

Actually, the usable bandwidth can be much smaller than this. As you mention
below, part of the signal is cut off on receive, but it isn't necessary to have 100%
to maintain 100% intelligibility. A worthwhile trade off to improve
system gain.
>
> Note: You can copy Morse with a narrower filter than 400 Hz, but you
> are clipping off part of the transmitted signal when you do. That
> signal still spills over onto other users within +/- 200 Hz of the
> carrier. That's inherent due to the sidebands generated by the
> keying shaping.

Yes, but evey form of "channelization" has a guard band requirement
for this reaso. Although there isn't such a thing on amateur HF,
it is inherent in the way we operate - for the most part.

Use square shaping and the key clicks spread over
> tens of kilohertz (theoretically over an infinite bandwidth) causing
> interference to other users.

I must admit to having very mixed feelings about a morse test.
You can argue a bunch of different points on either side of the fence.
Some more legitimate than others.

At times, I would argue to keep the test as morse can be looked at as
a basic simple digital mode, which can be implemented at will.

On the other hand, there is the point that no other mode has
such a requirement. And this point can be argued as to the why's

and why-nots of it's merits. I do see a day soon when the
international treaty requirment is dropped and then I suspect the
FCC will indeed drop the testing requirement.

The real weakness in compandoring comes in fading and multi-path
situations found in land-mobile operation. Indeed, on a solid
point-to-point link, it would be a worthwhile addition and
has been used commercially on FM, where the situation required
the users HAD to use headphones. Here, it reduced the background
noise making the operation of the equipment less tiring.

3267. Need information, remote phone

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-23 00:00:00 UTC
From: wduembeg@qualcomm.com
Message-ID: <4qjvpu$84h@qualcomm.com>
Source record: 36213

Hi to every one,

Let me start by describing my current situation. I currently live close to the Mexican border, I have been thinking for a while about moving to Mexico since living expense is a lot more affordable there (Not on everything.)
My problem is communications, the phone service in Mexico is up to 4 times more expensive than in the US, and If I move I need a phone connection to my work computer and to the WWW. If I where to do this from Mexico I would probably be spending about $1000.00 per month (not a pretty situation :<).
In any way, If I move it will be close to the border, I was thinking about putting a phone in a friend's house (he lives close to the border too (US)) and having a remote phone connection, that way I could have my computer in Mexico and still be able to use the WWW and communicate to work at a affordable price.

Does any one have any Ideas or know of a device or apparatus that would allow me to have a phone at 2-4 miles away and to wire-less connect to it.

Any help or directions would be greatly appreciated.

>
>A = SCS PTC-II

Yes.

>B = AEA (probably a PK-232)

Maybe. All we know is that it is an AEA product. There
are 4 possible choices in their line.

>C = HAL (probably a PCI-4000)

The article gives this away, it's a P-38 in their bench tests. The
PCI-4000 was used in the FEMA over the air tests. That's one reason
why Clover didn't look as good in the bench testing, the P-38's top
rate is only half that of the PCI-4000. Look at their clear channel
table's numbers.

>D = Kantronics KAM

Yes.

>Of particular interest is the fact that at low SNRs, modem A had nearly
>twice the throughput as modem B on Pactor-I. This seems to take the
>mistery out of the value of the analog memory ARQ using an analog to
>digital converter - something SCS and Paccomm have been saying for a
>long time.

Yeah, and Shannon first said it in 1948. Never throw away *any*
information about a signal until you no longer need it. However,
the SCS box has a huge amount of DSP horsepower to throw at the
problem too, and that can't be overlooked. It may simply be doing
a better job in recovering the symbols in the first place.

What surprised me the most was the relative showing of GTOR
under good signal conditions and the relatively poor showing
of Clover under low SNRs. My experience with the P-38 indicates
it works well with very low SNRs. After careful reading, I
noted in the text that the authors said that they restricted
Clover to the "Fast" RS coding. If they had let the modem
select "Robust", weak signal performance likely would be more
in line with what I've observed.

The GTOR showing was surprising too. It appeared to work
well at low SNRs with good path conditions, which isn't
unexpected thanks to the heavy Golay ECC. But it also held up
under poor path conditions (with greatly reduced throughput
of course), and that is surprising considering the simple
FSK signal form and relatively crude analog filter modem.

That seems to say that signal coding is much more
important than an optimized modulation form or superior
basic modem performance. But I wonder if the simulation
took fully into account the effects of multipath. The GTOR
symbols should be much more damaged by that than the Clover
or PACTOR II symbols (both of which operate at a much lower
basic baud, contrary to what the authors' table 3 indicates,
which shows the *composite* baud of these systems).

But the authors seem to posit an opposite relation in their
conclusions. I'd note that they seemed a bit confused between
FSM and PSK in that area too. They called both Clover and
PACTOR II PSK modulations. PACTOR II is PSK, but Clover is FSM.
The difference may appear subtle, but it is significant, as
observing the waveforms of the two systems on a spectrum
analyzer demonstrates.

The apparent superiority of PACTOR II also highlighted something
else, the worth of a high performance DSP engine. The SCS box
has lots more DSP horsepower than the P-38 (but you pay a serious
$$$ premium for that extra horsepower). As DSP costs continue to
decline, we should see this benefit move to more cost effective
platforms.

I'd like to hear others' real world experiences with these
systems, especially under severe multipath conditions like
those often found on 80m NVIS paths.

Gary,

I think we're looking at it from different perspectives. I believe you're talking about the evolution of a technology, while I'm simply conveying the relative effectiveness of the tools. The steel axe (Morse code, especially as CW) and the chain saw (SSB, digital, etc) are both useful tools depending on the job to be undertaken. Even though the steel axe was developed long before the chain saw, it continues to be used today because of its attributes as a cutting or chopping tool. I suspect that, while lumberjacks cut trees with chainsaws, a good steel axe complements their toolbox.

From my perspective the drums or smoke signals would be analogous to the stone axe, since they are among the most primitive means of "long-distance" communication.

Best regards,
Lindsay

I've never used a digital mode (besides CW). The ARRL
Handbook is not clear on ASCII so I have a few questions:

Are HF ASCII stations common?
Is ASCII combined with higher level protocols like AMTOR, etc?
Is the HF ASCII shift 170 Hz?
What is the most common HF ASCII baud rate?
Is Baudot more popular than ASCII?
What is the most popular HF digital mode?

thanks and 73, Cecil, W6RCA, OOTC

3271. Help w/Kam and FT-767GX!!

Newsgroup: rec.radio.amateur.digital.misc

Yeah, that is the one claim to fame of Morse today, universal
interoperability. But I'd suggest that's a historical artifact
of current regulations. It would be just as easy to craft regulations
placing some other method in the universal slot, if the regulators find
universal interoperability a necessary condition of amateur usage.
They apparently do not, however, because they don't require us to
maintain a Morse capability once we are licensed.

>Throughputs range from 6 to 40
>> char/sec, or roughly 72 to 480 WPM, well above the capabilities of

>it has actually ever been quantified as to how tough the situation has
>to be before an experienced operator will give up. It would be
>interesting to know.

More to the point, how many are truly *experinenced* operators?
(Survey says, less than half, and there goes your universal
interoperability under emergency conditions.) And how long is
too long to hang in there? According to FEMA, even AMTOR is too
slow to trust for emergency situations where the information is
almost always time critical, and where absolute accuracy is often
essential. Note that PACTOR II claims to be able to function
with a CNR of -15 db. That's below the threshold of audibility
for a Morse signal, so in that case it wouldn't matter how long
even an experienced Morse operator hung in there.

>While voice, at 120 WPM, is faster than Morse, some of the newer

>emergency operations senario. And yes, I know that actual CW usage during
>the aftermath of a disaater isn't the major mode - especially in the
>affected area, where VHF (and up) FM voice rules the roost.

That's correct, Morse usage in real disaster situations is practically
(if not totally) non-existent. And addressing the other point, almost
all of the boxes implementing newer protocols have fallbacks to more
mature methods (usually all the way down to RTTY). And even RTTY usually
offers better performance than Morse. My P-38 can copy RTTY down to levels
where I couldn't copy Morse, certainly not 60 WPM Morse.

(Note I don't claim to be a great Morse operator, but I did handle lots
of NTS traffic on Morse at one point so I'm probably more skilled than a
lot of HF amateurs.)

>Truth is, packet would be a much better way to go, but, not

>a portable set-up. We are currently facing this dilema here in my area.
>We want to implement some sort of packet program
>into our emergency plan, but have to admit that there aren't enough
>local hams with portable packet stations. So, FM voice, wins again
>by default. Some day though. . . . .

VHF/UHF packet certainly can play a role in disaster communications,
and has been used for logistic support in that role by a number of
groups. But HF packet? Forget that, its a lost cause. We're going
to have to reinvent packet to make it work usefully on HF. (That's
an interesting challenge, of course, and something we should be
working on.)

>>>A couple of people suggested that the proposed HF no-coders would learn Morse
>>>once they encountered the congestion. Of this I am skeptical,
>>
>> I don't think so either. There are much superior non-voice methods

>If Morse is on welfare, it is our own doing. The mode will percieved by the
>image we project for it. And while there are those who may learn it for
>nostalgia. In my experience, when properly presented, Morse is then something
>that is WANTED. It also makes the learning process much easier.

Yes, you catch more flies with honey than with vinegar (and that's why many of the Morse proponents are doing Morse a great disservice by claiming it is an "effort" test). When Morse is seen as something useful, rather than as an obstacle, people are more willing to want to use it. And of course, to use it, they find that they have to learn it. But I think that if people look at the various options open to them today objectively, many of them will be more likely to want to use something better than manual Morse.

>> Note: You can copy Morse with a narrower filter than 400 Hz, but you
>> are clipping off part of the transmitted signal when you do. That
>> signal still spills over onto other users within +/- 200 Hz of the
>> carrier. That's inherent due to the sidebands generated by the
>> keying shaping.
>
>Yes, but evey form of "channelization" has a guard band requirement
>for this reaso. Although there isn't such a thing on amateur HF,
>it is inherent in the way we operate - for the most part.

No, for example Clover has a very sharp cutoff characteristic and is -50 db at +/- 250 Hz from the channel center. It fills the channel, but needs no guardband. This is one of its advantages. Adjacent channels can be used with no mutual interference (assuming the receiver is capable of that selectivity). But no amount of receiver selectivity can solve the problem of sidebands falling *inside* an adjacent channel's passband, so Morse must be considered a modulation with a 400 Hz bandwidth requirement.

Amateurs tend not to view things on a communications system basis, but they should. We need to look at the effect on the total system, including all the other users on the band, and not just at our particular requirements, when we select modulations and operating methods. That way we can hope to approach optimum tradeoffs for the total system and our particular task. BTW that's why SS is so attractive. It offers total system advantages we can't easily obtain with other methods.

Yes.. we have such a system here in Houston. Our Clear Lake ARC has
an internet/packet gateway.. we give full internet access.. telnet, ftp, www,
email etc... we have over 200 users who come in via packet! We have
converse and links to other ham gateways etc.
We run Linux with the ax25 utils.. a special form of login and you are
presented with a full UNIX shell account.. we have set up some features
to make life easier for the non-UNIX folks, but basically the mail, telent,
ftp are pure UNIX. No JNOS/TNOS.. just pure Linux.. works like a champ. We
put it on the air OCT 15.. and the packet community here has fallen in love
with it.

>is today, and where it is going to be in ten years at the present rate
>of decline, the future looks bleak," he wrote, citing competition from
>unlicensed communications modes. (internet).

Gee. And I thought it was the equipment manufacturers who were the
driving force in ham radio today.

I wonder what would happen if these manufacturers expanded their
product lines to more than 2m and 70cm nbfm radios with differing
face plates?

As we all know how beneficial the practical knowledge gained through
amateur radio is, perhaps companies like Microsoft are purposely
trying to murder 'our hobby' so as to minimize competition in the
future wireless world by limiting the ability of future engineers and
technicians from gaining self-taught, practical experiences.

I've been using one 24/7 for over a year now. It's a dynamite little
radio. Like any packet radio it needs to be aligned properly to work
best. You'll probably get some bad reports from the ignorant who
didn't align it properly. If anyone tells you to use an HT you can
immediately assume they are from the crowd that thinks it's ok to run
200ms TXD's (i.e. they don't understand what is going on).

The MFJ runs very reliably down to about 30ms TXD with a good TNC
(I've used both a Data Engine and a KPC9612) although you usually end
up running about 100 or 120 because of slow synthesized rigs someone
is running.

The RX sensitivity actually turns out to meet specs. You just have to
realize that quoted SNAD numbers are for voice audio bandwidths. If
you put a low-pass 3.5 khz filter in the audio path you will get the
rated RX sensitivity on a service monitor. Of course this isn't a good
way to align a 9600 rig but explains the sensitivity numbers.

Source record: 36233

Hope I'm asking this in the right newsgroup because I haven't seen any other postings in here about BBS systems, so perhaps there's a newsgroup somewhere devoted to BBS issues?

I have had reports from the USA of problems when running WinPack with the W0RLI mailbox system, so I thought I would set up a copy of W0RLI to find out exactly what goes wrong. I found a very old copy - version 12 I think it was - which I managed to get running ok. When I looked for something newer I found V19.7, which needs DESQview V2.5. That was a problem because I only have V2.42 and I don't want to go out and buy a new version of DV just so I can do a bit of testing.

Does anyone know how many versions of W0RLI I will have to go back before I find one that will run with DV 2.42, and where I might find a copy of a suitable version?

There was a time when they supposedly did, but I don't ever remember
being asked to go down to the FCC and prove I could do it. Same with
logging. I know when they dropped the logging stuff, I can't put my
finger on when the FCC decided to stop, uhm, advertizing their
right to ask you to prove your morse capability.
> Note that PACTOR II claims to be able to function
> with a CNR of -15 db. That's below the threshold of audibility
> for a Morse signal,

I don't remember seeing this spec anywhere. And what is meant by "function,"
maintain a link? Pass a certain amount of data?

I would also like to know where
that -15dB is being measured. Is that at the speaker teminals of the
receiver, or after the final filtering done by the TNC?

No, I don't expect you to answer these, just pointing out that claims
are easily manipulated when worded broadly - i.e: The Maxon Antenna matcher!

Still, in a recent review of different digital modes used by hams today,
PACTOR II was head and shoulders above the rest. (July 1996 QST, pg 35)

At 0dB SNR (not mentioned where that was measured, but I suspect at the
receiver audio out terminals) the throughput was 6-7 char/sec.

BTW - In a 250Hz bandwidth, we can copy morse at 20 wpm to
very nearly 0dB S/N. This doesn't take into account the
operator however. I remember once copying a CW signal buried in a
movie soundtrack - this was in High School and the film was on WWII.
I remember blocking out entirely the voice track and other stuff
once I heard the morse. I'm jusdt glad we were't asked any
questions later about the introduction!

the path is slow and painful in getting acceptance. Like VHF(and up)
packet at 28.8K in the standard voice bandwidth(2700Hz)
and without rig modifications.

CLOVER is a unique example. Hats off to HAL though for having the
foresight to make full use of the DSP to reduce sidebands.
In the case of CLOVER, the guardband is minimized to the
absolute minimum possible, but some is still required due to
nonlinearities in the transmitter, receiver weaknesses and
frequency stability issues.
> BTW that's why SS is so attractive.

I must admit to not being really up on Spread Spectrum. I know enough
though to understand it indeed offers a lot. Maybe someday I'll get the
chance to tinker with it.

Gary, always a pleasure!

It was also used in the amateur community for years, albeit unknowingly
and not in the most friendly fashion. Much of the early development work
took place in the sixties and seventies right on the amateur bands.

Have other hams thought about what happens when you use an audio speech
processor between the mic and SSB transmitter? You limit the peaks, shape
the bandpass, and compress what's left. That's exactly what ACSSB does,
and also what good and technically innovative amateur operators do to earn
high contest scores and DXCC Honor Roll positions.

Now drop down to the "newbie contester" levels. Forget the external
processor, after all it costs money (and requires technical intelligence
to operate). Just crank up the mic gain so "I sound louder." Here all
the processing is done by the formerly linear amplifier stages being
driven into cutoff during part of the operating cycle. Both audio and
carrier harmonics and splatter greatly increase; we've heard these signals
on all the HF bands, especially during contests. They can be routinely
found on 11M+ if you happen to listen there.

Either way, we've been listening to processed or compandored SSB for many
years, but nobody patented it because it was a logical extension of the
current art. Once people discover the efficiencies of doing it,
unprocessed audio will be a thing of the past [set flamebait on] like
Morse OOK CW [set flamebait off].

Now if you want to be a real hit on the FM scene today, use heavy audio
processing for both voice and 1200b packet. Get your 1100 Hz average
deviation up to 3-4 kHz where it completely utilizes the available channel
bandwidth. The only reason that compandored audio is in so few commercial
FM radios is that the chips NEC designed for the purpose umpteen years ago
only worked over a very limited temperature range, nowhere near the -30 to
+60 C required by the mobile communications industry.

: Does any one have any Ideas or know of a device or apparatus that
: would allow me to have a phone at 2-4 miles away and to wire-less
: connect to it.

: Any help or directions would be greatly appreciated.

Of course, you do realize that part 97 states that Amateur radio is not
meant to replace communications services available elsewhere. In other
words, Amateur Radio is not meant to replace the Call Phone system, etc.
What you are proposing is definatly technically possible using phone
patch equipment, but there may be a legal issue if you are using it
regularly to simply avoid using the established phone system.

If I am wrong on this, PLEASE correct me!

I was surprised by this too, given my experience with the P-38
running Clover under poor SNR conditions. The authors had a good
idea with these comparisons, but IMHO they didn't try nearly enough
options or combinations to draw any significant conclusions (other
than perhaps that the PK-232 has seen better days, at least in HF
service. At least I hope it wasn't one of AEA's DSP modems which
performed so badly.)

Hello

Actually the comparison data is good, but the conclusions
are at best unclear. I am working on a piece rebutting
the conclusions, but not the data.

GTOR is shown to be more powerful because of it's very
wide (300 baud) bandwidth, not because of robustness.
Look at CCIR poor and you'll see it just falls FLAT.

CLOVER was also cheated because the AM (4A) modulation
deteriorates the ROBUST performance... They goofed on
that... but the points of data on the chart are accurate.

If anyone has more info, opinions, conclusions, etc, please
pass them along to P. Sussman, pactor@dnaco.net

The PSK modes (PACTOR II and CLOVER) got a 'short' from a
few other misconceptions about PSK. It is NOT worse under
poor signal contentions, as noted. The problem was not the
facts, but the scales on the graphs making 'bad' look 'good'
by rough comparions.. when far and away the numbers (true points)
were just not there.

Thanks..

P. Sussman

>What is the most common HF ASCII baud rate?
>Is Baudot more popular than ASCII?
>What is the most popular HF digital mode?
>
>thanks and 73, Cecil, W6RCA, OOTC
>
>
The only ASCII that I have ever received was the ARRL. They run Baudot,
ASCII and CW. (ASCII time permiting) AMTOR (SITOR) uses a special,
non ASCII "language"(ITT/CCIR teleprinter aphabet # 2 or something like
that, I do not have my refferences here). Baudot is by far more common
than ASCII, but it is being supplanted by AMTOR, and other more exotic
protocals(like picalo{spelling?) and TDFM. There are almost no rtty
press(new services) left on HF, they nearly all gone to sat links.
Coastal marine stations use SITOR(nearly the same as out AMTOR) and some
CW. Most sitor is 170Hz shift. Give WUN a look at
http://www/leonardo.net/berri/wun
They have a wealth of information, freqs, scheds, FAQS, and even "sound
clips" of the various "rtty" formats. There are some simple programs,
(hamcom comes to mind) that allow the reception of most "rrty" formats
with a "simple" op-amp circuit connnected to the serial/asynch port
on an IBM clone pc. For fax there is JVFAX(it uses the same op-amp
circuit), and programs that use a sound card (WXMAN2 and FTV-DEMO..amoung
others) instead of external hardware. RTTY and FAX reception can be fun
and informative. There are still a view wirephoto fax broadcsts to be
found on the HF bands.
Good hunting!

3303. TAC-310SX 9K6 mods continued

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-24 00:00:00 UTC
From: <>
Message-ID: <1996Jun24.171939.28475@nosc.mil>
Source record: 36249

So far, I have recieved a couple of inputs for 9600 baud modifications to the TAC-310SX 70cm radios. These were to change out C339 to 1.0uF and to insert an opposing set of diodes (1N4148) and a 4.7K ohm resistor assy in between IC104, pin 5, output of R105 and C110. [Circuit mods done by WA0ZNL].

There is also a source for the Eproms, from Kyodo West in PA at $20 for the first on and $10 for each additional Eprom. 1 [800] 535-2082.

Has anyone else done any successful modifications to the CODED/RCA TAC-310SX series radios?

73, John AA6QN

3304. Kantronics DVR2-2 9K6 mods Cont.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-24 00:00:00 UTC
From: <>
Message-ID: <1996Jun24.173124.28715@nosc.mil>
Source record: 36250

Well I am getting closer to putting up a 2m TCPIP user node. I did recieve some ideas on how to cure the DVR2-2 front end problems. Aside from making 4/5 T stub for the frequency of operation, I liked the idea of using the helical resonators. I believe it was mentioned that Tucker Electronics has an 2m brick that has these resonators inline as well. What I didn't ask was weather or not the interal relay was rated at 9K6 switching times. Is there anyone out there that is using the brick mentioned in a 9K6 circuit?

73, John AA6QN

3305. Searchinf for a FSK (or MSK) modem chip

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-24 00:00:00 UTC
From: patjarry@aol.com
Message-ID: <4qmlg8$ga0@newsbf02.news.aol.com>
Source record: 36251

Hello,

I don't know if this is the right newsgroup to write to, but I suppose
that I can give it a try anyway :)

I'm a computer engineer searching for a MSK (minimum shift keying) modem
chip for a design I'm working on. The only problem is that it has to
operate with the European standards (ETS) for PLB applications, which
means a carrier detect for a bandwidth of 900Hz, more specifically between
700Hz-1600Hz.

I'm not very familiar with communications, so some of the terms I'm using
may not be exactly right. And by the way, sorry for my English, I'm from
Quebec, Canada, so my first language is French. :)

Thanks,

Patrick Jarry
wolf@step.polymtl.ca

Just a point of interest; it is evident that a couple of dB gain can be had from using soft-decision memory ARQ, regardless to the contary that they want you to believe. One point that is often overlooked, especially if you have sufficient computing horsepower, is that you may oversample each symbol, then, first, by brute force, for each of the sampled points, try find a valid CRC for the frame, if this doesnt work, second, fall back to soft-decision memory ARQ, also using the oversampled symbol samples. I do this in my PSA soundcard Pactor-I implementation and the program shows you the statistics on the satus line of how this two-level error-correction scheme works. I also use full 16-bit quantising for memory ARQ, however, I believe it should work just fine with much fewer levels.

The power of coding should not be overlooked, neither the tradeoff between power-limited and bandwidth-limited signals. Also never settle for a mediocre demodulator even if you use the world's most powerful coding scheme. I have some further points, but we'll leave that for another time.

3308. CW can not die...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-24 00:00:00 UTC
From: maccabeus@gatecoms.gatecom.com
Message-ID: <4qmck7$3f8@www.gatecom.com>
Source record: 36254

CW has a major advantage over phone. It can get thru where voice can
not. ESPECIALLY for emergency communications. It has the ability to be
used over longer distances and still be readable. It is EFFICIENT for
those who are motivated enough to learn it. CB is for the lazy; not
Amateur Radio. I got my Tech+ in may and was harrased mostly by techs
that thought I was stupid for bothering with code. I know personally
that these are also only interrested in their radio as a cb
replacement. I pzarticipated in Field Day this week end and tried some
phone but kept comming back to cw. I totaled about 12hrs cw. ^hrs in
a single stretch and I had more fun in there than anywhere. Maybe my
10wpm isnt great but it was successfully fun.
Try it and have a positive outlook. It isnt hard, it just take some
actual working to build up. you cant be lazy, but it pays off!

Who cares what Macroshaft thinks? I certainly don't...

Kenwood's opinion, on the other hand, has a little more weight. One reason their sales have dropped, though, is that their equipment is expensive! (well, to me anyway... I'm only 21...) For the past six years I've been a ham, I've survived on equipment I bought at hamfests and fixed up, or equipment I've built myself. Very few of the hams I know can afford to buy new equipment from Kenwood... Building it is more fun anyway.

Oh, I'd love to be a corporation! Nearly infinite financial resources compared to the average ham! Faster than a speeding bullet, more powerful than a locomotive, able to gobble up huge amounts of the spectrum in a single round!!!

3319. SPRINT-2 / SPIRIT-2 question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-24 00:00:00 UTC
From: Rob Dover <robd@netshop.net>
Message-ID: <31CF579A.5BF@netshop.net>
Source record: 36265

Greetings.
I have just purchased 2 of the SPIRIT/SPRINT TNC's and have run into a curious problem. I have 1 SPRINT and 1 SPIRIT and both exhibit the same problem.
I am trying to configure them with TheNET X1J4 firmware. I have both TNC's set with all jumpers configured for TheNET style network firmware. The problem I am having is that the TNC's randomly scramble the callsign that has been burned into the ROMS. This seems to happen about once for every 4-6 power off/on cycles. It seems related to the way TheNET EPROMs bankswitch but those signals appear OK. If I install TheNET version 2.08 which does not require any bankswitching all is just fine.
I have 2 different X1J4 EPROMS and this problem is the same with both EPROMS regardless of which TNC they are installed in.
The TNC's I have are the Backbone model.
Is this a known problem with this model of TNC or have I missed something somewhere.
Any help would be most appreciated.
Thanks 73 -Rob-

Your knowledge of Bill Gates's strategy is Hum NIL. This
guy's future strategy is the HOBBY market. The commercial
market is already in his pocket and saturated. Selling
upgrades is less and less profitable, people are fed up
with quaterly 200$ upgrades.

An immense subdivision of Microsoft is now working on
Internet tools and Games, yes Games. New tools for
programmers to develop Internet Agents and Animated Games
are in the pipeline. The hobby market includes world
communication via Microsoft private constellation of
satellites (not bigger than small fridges says Bill Gates)
directly to your computer.

Hams are one of the targets because they communicate for FREE.
And FREE is not a word that Bill Gates likes very much if he
is going after the hobby communication market.

Madjid VE2GMI
==========
And God said, "Let there be light." And there was light,
but Microsoft said he would have to wait until Monday
to be connected to MicroSoftNet. And God rested Sunday.

And Monday God saw the light and it was good.
Then he saw Microsoft's bill and that was not good.
So he became a ham radio operator as G0D.

This is rather interesting. In an article I read while doing a report on
Bill Gates (also mentioned in QST, but I will have to dig it out) Bill
Gates and Teledesic (Bill Gates' LEOs company) got on the WRC 95(?) agenda
at the time of the convention, which is nearly impossible, and asked for
something like 10Mhz of spectrum in the microwave bands and received it.
Nothing was ever mentioned about anything lower than Ghz. Besides, with
all of this hype about high speed communications and live video conferencing
I think you would need more than what the vhf band can supply.

Just my $0.02
Mike

Enjoy the mode Phillip! It may not be everyones cup of tea but you
need to think of it as a second language. You may not speak Russian,
and many of them do not speak English, however you can carry on a
pretty good conversation using CW & prosigns. Many think of CW a
drugery but it is still one of the most effecient means of world wide
communication (where not everyone in the third world has a cellphone,
TNC & computer), and effecient from the perspective of spectrum usage.
Many forget that SSB came about to conserve spectrum. SSB replaced AM
and it's just a matter of time and numbers till something else will
replace SSB. If you continue to use your CW second language for any
period of time you will come to appreciate it even further than you do
now. 73 & hope to hear you on the bands!

The True reason why the code requirements will be eliminated is to sell more Hf rigs. The radio manufacturers realized that not many new operators were coming into this hobby several years back and lobbied they ARRL and FCC (and probably gave somone kickbacks) to have a no code test. Well this worked out great and uhf and vhf radio sales have never been better (ie radio shack has 2 different mobile 2meter rigs) Now they want the same to happen on hf radios, wich happen to be just a little more expensive than a vhf radio. I am tired of hams who have code privelages pointing fingers and such. Well we will soon be the majority. And some of us dont care to even use hf. And for those of you who think you have done some great feat by passing your code test and joining the ranks of the elite, have you ever seen the manual that comes with a multimode controller? You think code is difficult? You see politics and money come to play here and the arrl or the fcc will do what they want. Which will be what the radio manufacturers want. And those of you who disagree are probably the smae ones who said there wouldnt be a no code test in the first place.

Gary Coffman generally has some pretty smart things to say, and he says them well. But I question his continued put-down of learning Morse as "conditioning a wetware modem" or as the equivalent of "knapping a stone axe."

By the same reasoning, why learn to walk or ride a bicycle? Why not just issue kids their own little tri-wheeled scooter, with digital fly-by-wire joystick control, as soon as they're old enough that they can form a desire to go somewhere?

Well, it's because walking or biking will take you places without expensive equipment, into conditions where that normally higher-performance equipment simply won't cut the mustard. Morse is the champion of graceful degradation, able to get through conditions of unpredictable fade or QRM with the unmatched self-adapting wetware at both ends to make real-time decisions about repeating, adjusting speed, and the like. It's a universal standard of impressive longevity, unlike digital protocols.

I have recently come to the conclusion that Morse proficiency is not, however, a rational prerequisite to HF amateur radio operating privileges. The purposes of the Amateur Radio Service, as defined by FCC Regulations, are materially advanced using Morse Code only in modes such as moonbounce communication. And this is done on frequencies where Morse skills are not a licensing requirement. Every other argument for the Morse requirement on HF boils down to saying that a small pool of operators who can converse at 20 wpm is more useful than a larger pool of operators who can copy an SOS at 5 wpm and alert appropriate agencies to the need for assistance.

Wilderness QRP operation will continue to make Morse a useful skill. Pure enjoyment of something different from ordinary talking will continue to make Morse a popular form of radio-based recreation. That's not a reason to require it for a license. Neither is it appropriate, however, to dismiss it as a skill whose enjoyment brands the operator as other than a "modern" ham.

Hallo!

At our area in Czech Republic (mostly influenced by German software)
GP and SP program are very popular (I'd say 80% of OM's are using
them). Unfortunately we have only German and Czech version of CONFIG
files but if some of you want any help or comment there is a lot of
experience.

Regarding TFPCX - first you should install TFPCX correctly and after
just run GP, it recognizes TFPCX with no problem. Tip: especially here
in Europe we're using DAMA nodes and with that it is much better and
correct to use TFX (latest version here seems to be TFX2.7b9). TFPCX
is no more updated, TFX is.

Run TFPCX -PCOMn ... where n is number of COM port,
run TFX -c:n ... where n is number of COM port.

:>73 from Demetre - SV1UY - IP coordinator of AMPRnet in Greece

:The T/R switching is most likely to slow for Amtor or pactor.
:Gary [gfiber@halcyon.com (Gary Fiber)]

HELLO, DEMETRE,

I use the IC-730 for AMTOR and PACTOR. I discovered that a very
minor modification was required to make it work in either mode.

There is a FET switch that has a delay designed-in causing the
receiver to come up too late when switching from transmit to
receive. My cure was to shunt R9 on the "FSW" board with a
180K resistor.

The trick, however, is gaining access to the resistor.

My IC-730 has been a work-horse for 13 years and still serves
me well. Send me private e-mail to share info on the 730.

73,

Dick - W7DHS

Hope I'm asking this in the right newsgroup because I haven't seen any other postings in here about BBS systems, so perhaps there's a newsgroup somewhere devoted to BBS issues?

I have had reports from the USA of problems when running WinPack with the W0RLI mailbox system, so I thought I would set up a copy of W0RLI to find out exactly what goes wrong. I found a very old copy - version 12 I think it was - which I managed to get running ok. When I looked for something newer I found V19.7, which needs DESQview V2.5. That was a problem because I only have V2.42 and I don't want to go out and buy a new version of DV just so I can do a bit of testing.

Does anyone know how many versions of W0RLI I will have to go back before I find one that will run with DV 2.42, and where I might find a copy of a suitable version?

Greetings,

I just got WISP configured, but I get the error message
"Error - Unknown KISS data type 10" in the upper right hand
corner as data is received. I selected the option to log
KISS data to disk, and it is definately getting data from
the sats (KO-23, KO-25, UO-22), but never "recognises" it.

Can anyone help???? I am using a 486DX4-100/PK-900/FT-736R.
PK-900 firmware is 05.MAR.93. WISP release 9603.

Thanks in advance for any help.

Source record: 36282

>>I'm seeking information on how I may interface a Kantronics KPC-3 TNC
>>with an Alinco DJ-580T HT.

I have seen several msgs requesting details on how to connect a TNC to
the ALINCO DJ580 h/held,so heres how i did it !!!
(after immense fiddling,these are the connections used for 6 months)

```
tip .. ..ring ....body
. . .
. . .=
O [] ======== 3.5mm plug
. . .=
rx audio ...... . .
..n/c ..gnd

=
O [] ======== 2.5mm plug
: =
TX audio......:
---
: : 10 k resistor
: :
---
:
TX ...........:
```

so,the only connection to the 2.5mm plug is to the TIP!!!! tip=TX audio
TX is to tip via 10k resistor. "sleeve & ring" NO CONNECTIONS

RX audio=TIP of 3.5mm,sleeve NO CONNECTION,body=gnd

Please let me know if this is of any use to you.
don't forget- DO NOT insert/remove plugs while the rig or tnc is on !!

What you've described is only half of an ACSSB system though. At the receive end, the signal is then uncompressed, or expanded, to regain the original dynamics.

This is where the problems come in. Staic and other signal interruptions, such as multipath, create havoc with the compandering process. The thing I liked about ACSSB is the pilot tone which provided a means of automatically fine tuning the signal to the correct frequency.

> Now if you want to be a real hit on the FM scene today, use heavy audio
> processing for both voice

I heard this once recently. A fellow who was operating on HF, switched his Icom IC-706 over to 2m FM voice with the processor still on. Oh man, I can't begin to tell you how bad this sounded! Particularly since he was mobile! His intelligibility went to nearly zero! Of course, there was no expander on my end to "recapture" the original dynamics.

and 1200b packet. Get your 1100 Hz average

There were other companies that made compandorong chip sets.
(National Semiconductor or Signetics come to mind)
The real reson is that it really didn't gain us anything, except in special situations where a received signal to noise ratio greater than 60dB was required.

: What should I measure?

Dennis,
Depending upon what sort of SA you use, you may be able measure more
than one way. An easy way that I often use is to use slope detection.
Generally the resolution bandwidth filters in an SA have well behaved
shape. This can be used to advantage.

With a span of ~5 times your desired modulation bandwidth, sweep a CW
signal; calibrator, 0 frequency or other stable source and observe
the display as you change resolution bandwidths (as contrasted to video
bandwidth which is post-detection).

You should be able to find a setting which provides a relatively
straight line for a considerable portion of its skirt at ~45 degree
angle on screen. This selection isn't critical, I'm just giving
these numbers as a starting place. Note the slope of this line, that is,
how many vertical divisions correspond to the desired modulation width.

Once you have found an approriate res bandwidth and have your device to
be measured suitably connected, adjust for a top-of-screen display.
Note what frequency on either side is more or less centered in the
straightest section of the resolution bandwidth filter shape determined
above. The amplitude response at this frequency will probably be at least
10 or 20 dB below the maximum at the center of the filter.

Now tune the analyzer center frequency to that frequency and go to zero span.

At this point you may want to increase the sweep speed, but it's not
imperative. What the display should now show is the FM, recovered by the
slope detection of the filter, with a sensitivity as noted above. When
you have set the amplitude of the recovered signal to be the same as
was noted above, your transmitter will be deviating the desired
amount. In addition, if you turn up the sweep speed so that it
sweeps in ~10 symbol times (baud/10 for digital modulation or perhaps
1-5 ms for audio), you'll be able to verify that the transmitted
signal is an accurate representation of the input modulation.

Hope this all makes sense and helps.

> David - AB5PI

Nothing (much) to worry about. This in an indication of data overrun from
the TNC to the computer. So the bytes got shifted in the packet and the
KISS data type was the wrong byte.

If you don't want to build the cable you can buy the MFJ-5024YV cable
which will fit the Alinco perfectly and work with Alinco/Standard/Yaesu.

I set the TXdelay to 35 with no problems with this rig.

3344. MFJ-784B DSP Filter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-25 00:00:00 UTC
From: pasek001@maroon.tc.umn.edu
Message-ID: <68629.pasek001@maroon.tc.umn.edu>
Source record: 36288

Now that I am down to using a 40 meter dipole and tuner for all band HF & SWLing work most of the signals I hear are near the noise level.

I read the ad in QST for the MFJ-784B and it sounds like it would do just about everything I could ever want for improving my current station's (Kenwood TS-440s) receive audio abilities. My main interrests are QRP CW, and receiving SSTV/WEFAX/RTTY/AMATOR.

Are there any users of the this DSP that can comment on the likes/dislikes or on how it compares to the TimeWave units. I guess what I'm asking, is it really as good as the ad claims??

Thanks for your comments.

From: miltf@staff.uiuc.edu
Message-ID: <4qpmuo$inp@vixen.cso.uiuc.edu>
Source record: 36290

I have the ADMS-2 and the 8500. The software controls all features available in the programming mode. It works very well. It is easy to use and easy to make changes. I found RT Systems (Rod) to be most cooperative with help and solving problems. (RT is the software source, and they do sell the radio as well). I also have the FT51R with ADMS-1 software. It works equally well. I have not tried to write my own, but the 8500 owners manual does give some instructions in this area. The manual claims an RS232 box is needed, but the ADMS software does not use one.

Don't forget Bill Gates (Microsoft) is one of the Major players behind
the Leo Satellite people who want to take over our Ham bands. It is no
surprise that they want to call it dead! Apparently Kenwood will be
making the electronics for them and are also willing to turn there backs
on us. I will never consider buying a Kenwood product.

Sounds good to me. Maybe we need to move from a CW test to more on regulations and basic technical info on the various modes. Heck, if we need a CW test to get on HF then why not a typing test too? The total bandwith used for the digital modes would be reduced to a fraction if everyone could type as fast as the computer can transfer data :)

Enjoy the mode Phillip! It may not be everyones cup of tea but you
need to think of it as a second language. You may not speak Russian,
and many of them do not speak English, however you can carry on a
pretty good conversation using CW & prosigns. Many think of CW a
drugery but it is still one of the most effecient means of world wide
communication (where not everyone in the third world has a cellphone,
TNC & computer), and effecient from the perspective of spectrum usage.
Many forget that SSB came about to conserve spectrum. SSB replaced AM
and it's just a matter of time and numbers till something else will
replace SSB. If you continue to use your CW second language for any
period of time you will come to appreciate it even further than you do
now. 73 & hope to hear you on the bands!

Hi Mike:
I still have an Apple][+ that works and it has a serial board in it that
I used with a modem. The software that I used with the modem is Modem 740.
I have used modem software (Telix on an XT) with a Kantronics KPC-3, but have been
looking around for something better with a split screen. I haven't tried
to put the Apple on packet yet, but that is the game plan for the next month
or so. Somebody in this newsgroup suggested SofTerm but I haven't found
it on the net yet. Let me know if you come up with any good software.

From: acs@friday.houston.net
Message-ID: <4qr54v$ltp@lurch.sccsi.com>
Source record: 36154

Hi Betty Ann:
If it were possible to do it, many hams would have already done it.
I think that modems use different frequency tones and possibly a different
shift than a tnc. I started with a Baycom "modem" for $50, and find that
it does everything that I need it to do except have a mailbox. I did go
out and buy a Kantronics KPC-3 for $130 but rarely use it. This will change
soon as I bring up a battery powered system here.

Let me know if you find someone who has converted a modem to tnc.

Thanks and 73 de A.C., W5EZM, acs@houston.net

Hi Gregor:
There is an online toggle to switch between German and English in
GP. In order to make it work at all, you load TFPCX first, then GP. It
is an excellent split screen program for packet.

Hi There:

I have a KPC-3 and a DJ-582T. All it takes is a 3k ohm resistor for
the PTT line to make it work. It is the same as for the Icom 2 at as
shown in the KPC-3 manual. Just use the mike and audio jacks on the top
and you're in business.

I've been a ham since the late 50's and can't recall anything
in terms of renewal requirements having to do with code speed.
There used to be a requirement of a certain amount of operation being
done, but that wasn't restricted to any particular mode as I
recall.

All BG know is how to get the most $$$ from the worst service,
If he can BUY all the R/F bands and start charging $$$ for using
them, he might start to come out with quite a few ham stuff, even
hiring people to make "MicroSoft Ham"... But it is impossible for
him to do so, so he just dump the market all together....

Consider what he says.... If OS/2 reach 1Million users, he would
restart OS/2 app development.... Well, OS/2 have over 12Millions
of users. And weeks before the OS/2 app development cut off, he
stated that there is no reason for him to stop OS/2 app development,
and yet, he stop the development a few weeks later.... I even have
a recording of Bill Gates saying "We believe OS/2 is the platform
for the 90's".... So much for a lying and cheating Businessman....

Like what other OS/2 user says, "If M$ won't support it, SO WHAT?
M$ isn't the only company in the world!" The same could be applied
to ham world.... M$ is only a GOD DAMN ISP and ISV, Gimme a BREAK,
do they have any measurable market share in ham software and hardware?
NOPE. They don't have any power in the ham world....

BTW: M$ lovers, check out PC World July 96' Page 101.

From: anto@jorh.edu.ee
Message-ID: <4qr02t$qub@horos.kbfi.ee>
Source record: 36162

Hi all,

Please reccomend some sources to understand what is the SSID
(Secondary Station ID) and how it's expected to be used.
Please make Cc: to my Internet address if answering here.

My exact problem is that I installed AX25 support for Linux
and I am able to keep only one one connection at a time.
E.G, when ES1XXX connects to my Linux box, I am not
able to connect to the station ES1XXX, despite I have
many windows available and he also has. With my TCP/IP
experience I expected that the multiple connetions are allowed
between two endpoints...

I have read (in some descriptions of BBS's) that there are
programs allowing the multiple use of the frequency (or port,
these must be the same in this context) but there also are
programs that do not allow the concurrent use of a port (frequency).

At last, how to make it possible that an amateur can open two-three
independent and concurrent sessions to my Linux.

Well there is the Baycom Mailbox, TheBox, F6FBB, AA4RE and others that do run
with a baycom modem (not that I think 1200 bauds is enough for a mailbox)
Then there is Linux software supporting the baycom ser12 modem...

Hello!

Greetings for everybody who lives in this big and various World.
Greetings for all who likes music or radio.
I am writing my message from Odessa.
It's interesting town, intercity near Black Sea
and here i'm making the tiny musical radiostation.
Even a small station begin to live when she has a pulsing heart.
Yeah, it's a transmitter.
Step by step i save up means for the transmitter.
Anyway i need your help.
You can write me a letter:

Valery V. Filin
Visotckogo str. 12, fl.24
Odessa, 270025
Ukraine

I'll glad to read your advices, opinions and simply good words.
Peoples who want help me are interesting for myself.
Maybe you have a records which must be on a radio.
Please, send your ideas.
And at last you can support me by small sum:

Commerzbank AG, Frankfurt/Main acc.no.4008869901USD
in favour of Imexbank, Odessa in favour of
Valery Victorovich Filin acc.no.001139619.44

Or the way trough the american bank:

The Bank Of New York, N.Y. acc.no.890-0054-808 in favour of
Dialogbank in favour of Imexbank acc.no.02000090088 in favour of
Valery Victorovich Filin acc.no.001139619.44

Thank you.
Warmest regards,
Valery

I'm planning on finally dropping my old DOS based packet program and getting a windows base program. I'm not necessarily looking for a feature rich program, just a nice simple, fairly easy-to-use program just to check into the local bbs and occasionally download or upload messages.

Can anyone suggest a shareware or freeware for me to try? It can be for Win 3.1 or Win 95. Thanks.

Ed WB6SAT ecgallup@mlode.com

3376. CW: WHO CARES?

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <31D23DB8.ABF@erols.com>
Source record: 36172

I think everyone arguing both sides of the morse issue fails to recognize that we agreed years ago through IARU representation and other international treaties that morse would be an appropriate HF requirement for hams. I believe this is still the status quo, even though technology has obviously changed the playing field.

You don't like it? Lobby for change. WARC 97 is coming up. I see no better opportunity to correct this problem. Though I am proficient with CW, and I find it is still a lot of fun to play with, I can see it isn't for everyone. Our hobby has to change to accomodate popular technologies or it will die.

Now please stop wasting good net bandwidth arguing whether one mode of communications is better than the other. One might as well argue whether Batman could beat up Superman. They each have their merits, Ladies and Gentlemen, so let's drop the issue there. Besides, this is a hobby where the objective is to have fun. It doesn't neccesarily have to be rational or meet some fancy technical criteria. If it did, you wouldn't have anything to argue about because there would be no ham radio.

[ok Jake, you can get off the damned soapbox now...]

73, and let's be civil out there...

You don't need Winsock to run Jnos, Jnos is a DOS program, Winsock is a
WINdows program.. You use Winsock with Windows tcp/ip programs, Jnos
has no use for Winsock...

If you guys were paying more attention to reality, you'd already know that Bill Gates and Microsoft have disclaimed any lust for the 2M and 70 cm bands. MS and Apple are major players in reallocating the 5.8 GHz ham band to low-power unlicensed computer networks. They need much more bandwidth for the RF network protocols they have developed, and those boxes are already in production!

The 202 family of modems uses the same tones as current 1200B VHF packet systems, in fact those were used for packet before TNCs became popular items.
FYI, it's the fastest wireline modem that works for simplex operation over a simplex PTT radio (the 103 can be used at 110B or 300B). All the other faster ones must hear a handshake signal from the receiving end while they are sending their originate tone sequence.
The TNC includes an embedded processor to decode the HDLC into simple ASCII so you can use a dumb terminal to see what's going on. In the old days you ran the HDLC conversion as hand-written code in your desktop computer, which wasn't easy on a Z-80 with 32k RAM!

Apparently you didn't see the earlier responses in this newsgroup.

In any case, MYCALL (and MYSELCAL) is your new currently authorized
callsign. MYCALL is the one used for all IDs sent automatically or using
the keyboard function. That keeps the FCC happy.
Put your old call in MYALIAS and MYALTCALL to cover packet and amtor
connect requests from those who haven't yet discovered that you sneaked
through gate 1. Once folks connect they will see your new call in the
message header line. You can also use the connect CTEXT and maildrop
MTEXT message lines to pass along your new call. And congratulations on
becoming a Real Radioman, no longer a Hot Dog Operator!!

One thing I wish the authors had done was to normalize the
data to occupied bandwidth. i.e. thorughput per Hz utilized.
Perhaps call this measure a "Shannon" (1 bps/Hz) ?

Agree. My experience with CLOVER indicates continued good link
performance down to S/N as low as 8-10 db. This is using a
PCI-4000, in "Robust" mode.

> I'd like to hear others' real world experiences with these

> those often found on 80m NVIS paths.

Wish I could comment on 80M CLOVER paths, but to date I've been
unable to solve a serious "RF gets into the computers" problem
with 80M. Continuing to work on that problem, and once solved
will put a CLOVER port on 80M.

You could use a RF radiation field servey meter that would give you mw/cmsq
The probes used for such meters are so broad banded that you would
have a difficult time determining which frequencies you are measuring.

The only way to get a good feel for the spectrum is with a spectrum analyzer.
You can connect an amplifier to your Yagi if the signals are low level.
You could build a spectrum analizer that would connect up to an o-scope but I
have never seen one that would extend above 1.2 without down conversion.

You would be much better off with a portable spectrum analyzer tektronics makes
a model 492P which retailed for ~ $12K US. Try a rental place or maybe Tucker
will rent/lease one for your measurements. They are on the WWW I don't have
the address handy. Use a search engine.

You would then need to calculate the free space attenuation of the signal level
you recieved and you could determine the approx tx output if you know the
distance from the emitter.

Chris

Yeah, 6 CPS is claimed.

>I would also like to know where
>that -15dB is being measured. Is that at the speaker teminals of the
>receiver, or after the final filtering done by the TNC?

SCS doesn't say, but I would assume at the receiver audio output,
same place you'd hook headphones for manual CW.

>No, I don't expect you to answer these, just pointing out that claims
>are easily manipulated when worded broadly - i.e: The Maxon Antenna matcher!

I'd suggest that even the broadest interpretation favors the PACTOR II
claim. If the figure is measured after the DSP filters, then it is even
more favorable to PACTOR II, indicating that the advantage is gained due
to baseband coding rather than due to superior filtering plus coding.

>Still, in a recent review of different digital modes used by hams today,
>PACTOR II was head and shoulders above the rest. (July 1996 QST, pg 35)
>
>At 0dB SNR (not mentioned where that was measured, but I suspect at the
>receiver audio out terminals) the throughput was 6-7 char/sec.

Yeah, and the SCS web page says that continues down below 0 db. Note,
that is properly CNR not SNR, IE carrier to noise ratio. For CW they
are the same thing, but that isn't true for some other modulations and
codings.

>BTW - In a 250Hz bandwidth, we can copy morse at 20 wpm to
>very nearly 0dB S/N.

Perhaps some can, I can't, but PACTOR II is doing 72 WPM (6 CPS)
at signal levels 15 db lower than that, *error free*.

>> VHF/UHF packet certainly can play a role in disaster communications,

>Actually, we are going have to reinvent packet for ALL modes. Of course
>the path is slow and painful in getting acceptance. Like VHF(and up)
>packet at 28.8K in the standard voice bandwidth(2700Hz)
>and without rig modifications.

That's unlikely to happen unless we make everyone use exactly
the same rig, and have exactly the same path characteristics
to every other station on the channel. The former might be
possible (though unlikely), but the latter is simply impossible.
Such subcoding requires a very well equalized channel with a very
good SNR, like a telephone line after training. It won't happen
with voice radios on a shared packet channel because there's no
way to equalize more than one pair of radios at a time, and no
way to assure equal path artifacts, IE multipath, SNR, etc. That's
why when we went to 56 kb we had to abandon the voice radio
paradigm and go to a true data radio with sufficient bandwidth
to avoid subcoding. Otherwise we couldn't connect to each other
at will.

3404. The real mans real hams test.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-28 00:00:00 UTC
From: Burt Fisher <kotzebue@juno.com>
Message-ID: <31D48DB8.7DDA@juno.com>
Source record: 36107
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

This test is for ham radio operators:

1. Do you say QSL on voice?_____

2. Do you say "For ID" after your call?_____

3. Is it rare for you to have a contact longer than 20 minutes?_____

4. Do you check into traffic nets to up the "body count?"_____

5. Do you check into traffic nets for any reason?_____

6. Do you participate in contests and like it?_____

7. Are you overweight and hold an Extra Class license?_____

8. Have your worked more countries than the number of sexual encounters with your spouse?_____

9. Are you a regular on a two meter repeater?_____

10. Do you dislike children in general?_____

11. Do you ask for help and when received from a number of hams send out a general thank you to everyone in the world?_____

12. Do you think it is wrong to talk about politics or other interesting topics on ham radio?_____

How to Score:

Number of Yes answers:

2 or less- are you sure you are a ham?
4 to 6- you are on the edge of being human or ham.
6 to 8-you are a typical ham-very boring.
8 to 1O-check your pulse, if you find one re-take test.
1O or more. Call the funeral home, send your name into QST as a Silent Key.

3405. HAM-server Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-06-28 00:00:00 UTC
From: server@GRAFex.sbay.org
Message-ID: <gate.836028922@GRAFex.sbay.org>
Source record: 36108

Distribution: world
Subject: HAM-server information

HAM-server was devised to allow people without direct internet access a way
to get amateur radio related programs and other information. It is not
directly on the internet, so ftp and telnet is not available.

Most of the files on HAM-server are available via ftp from the various sites
around the world that archive them. That's where I got most of them.

In addition to DOS files, there are some Mac ,Linux, and OS/2 files available.
I'm always on the look out for more (particularly Mac, Linux, OS/2).
See below.

General Information:
====================

There is a daily limit of ALL requests of 3-megs. There is an individual
limit of 1.2-megs. If there are a series of files you want to order,
stretch them out over a few days, rather than ordering all at once.
That way, you are almost assured of getting them all, and you won't be
blocking others from getting their orders filled.

ASCII (text) files are split at about 59,000 bytes. UUENCODED binary files
are split at about 750 lines.

A new INDEX is automatically generated every Sunday.

Ordering Information:
=====================

Send an email to:

HAM-server@GRAFex.sbay.org

In the text of the message, place:

HELP
GET /hamradio/INDEX.TXT
QUIT

HELP will send you the HAM-server HELP file. This is processed immediately
for return delivery.

o DOS

If you are using a PC and you do not have UUDECODE, order
UUDECODE.BAS or UUDECODE.C and UUEXE536.ZIP. Compile on your
system then uudecode UUEXE536.ZIP. This is a archive of UUENCODE

and UUDECODE, with documentation. This will work for DOS and OS/2.

o OS/2

I highly reccomend UNZ512X2.EXE. This is InfoZip's ZIP and UNZIP
(plus other stuff). Will dearchive PKUNZIPped files, as well as
UNIX zipped files.

o Macintosh

Most Mac programs are stored in binhex (.HQX). You will need a
utility, such as StuffIt to decode. There are also UUDECODErs
and other de-archivers available. See the index for
/hamradio/macstuff/utility.

o Linux

Use UNZIP.

Some Reasons Why Ordered Files Are Not Received:
==

o If you are ordering from a ccmail system, be advised that ccmail
in its default configuration attempts to automatically UUDECODE
files. If your order is sent in parts, it will hiccup after the
first part. See your system administrator.

o Your return path is incorrect. My bounce mailbox fills up quite
regularly with messages. And, since the path is incorrect, I cannot
contact you to let you know. Try the PING command to check that
the path is open.

o You have spelled the file name incorrectly. Check the INDEX.

o You have entered your request incorrectly. Check the HELP file
for correct syntax.

o The file name has changed since the INDEX was generated. Order a
new INDEX. See the HELP file for the NEWFILES command.

o You sent your order to me personally or in reply to this post.
Orders are only honored when sent to HAM-server@grafex.sbay.org.
That's the way the software works.

YOUR HELP IS NEEDED:
====================

If you have a program you would like placed on HAM-server, you can email it
uuencoded (DOS, Linux, and OS/2) or binhexed (Mac) to

incoming@grafex.sbay.org

This email address is set up to flag me that there is something new that I
need to take care of quickly.

John, Flexnet offers this solution, I am at the moment working on it
to make it work but I cannot find a way to make the ptt switch and the
soundcard to decode .. I can hear the soundcard transmitting the
packet (via speaker) .. but no more than that.

Ron.

Hello,

I will have in some days a TNC-24. I already have a PK232 for 3 or 4 years now. Can anyone tell me the major differences in the performances and in the use of these machines, I think this could help me to move from PK232 to the TNC-24 (wich have PSK built-in).

I know a few of you have been bothered by messages posted to these
and other amateur newsgroups by K1oik in the last few days.

It saddens me to think that within the brotherhood of ham radio there
are people who would go out of their way in an attempt to stain the
character of a fellow ham.

I thought everyone would be happy to know that we shouldn't be
bothered any further by this gentlemen, as his internet account has
apparantly been terminated.

Whoever the little worm was, I hope he had fun while it lasted, and
I would like to commend AOL for quickly pulling the plug on him.
Amazing how easy it is to make a little piece of dirt disappear down
the drain. I would also like to thank all the other hams who were
involved in notifying AOL of the problem. Solving little problems
like this are a shining example of what hams can do when they stick
together as a group.

On behalf of the hams on internet I would also like to extend
apologies to the REAL Burt Fisher, K1OIK, and tell him that we
realized (well, most of us anyway) right from the first posting that
the messages posted by this impersonater were no where near
the quality or caliber of what Burt normally posts, and we hold
him in no way responsible for anything posted by this second rate
AOL imitation of a real ham.

You're right that it was no where near the quality - the imposter used
real sentences with actual structure and coherence - that crack about CB
being too intellectual wasn't bad!

If k1oink (sic) talks like he types, it's no wonder he's frustrated that
no one will talk to him. To play the devil's advocate, one must be able to
advocate with some degree of facility. <g>

I don't know WISP, but when I would see an error like that in a KISS based program I would think about a problem with multi-channel KISS. type 10 (hex) is the type used for data received from the second channel of the TNC. Maybe WISP cannot cope with it, or has to be configured for it.

Let's be honest here for a change... Bill is a VERY schrew
businessman. I don't know when he said the quote above, but
at the time, he might have really believed it. As markets
change, a smart businessman changes with it. Only a complete
moron would favor a product owned 50% by his company over a
product he owns 100% that is gaining market share.

Let's get back to ham radio and leave the MS bashing to the
comp.* groups.

You're obviously uninformed about Mr. Gates' joint venture with a BOC to put up LEOs. I'm sure he's thinking about ham spectrum, even if he doesn't think about hams. (Maybe he didn't want the hams to gripe about his efforts on _his_ network.)

Source record: 36113

Greetings,
I am interested in getting into packet radio. I have had a tech license for a year. Packet is still a mystery to me, so I have a lot of questions. I plan to by a Baypack BP-2 TNC for $50 from Tigertronics. The salesperson told me they also have the BP-2M for the multi-mode version. What will multi-mode do for me? Do I need it? It costs $20 more than the regular version.
I will be using packet on my HP 200LX palmtop computer with a Yaesu FT530 HT. Has anyone had experience using this setup?

What about security? I assume when I connect to a packet station or BBS I will enter a username (my callsign?) and a password. Couldn't anyone with a packet setup see everything I type? Is this anything I should be concerned about?

73,
Jerry KE6UUX

Well I'm one of many who enjoyed them. It's refreshing to read
a bit of black humour and satire amidst a rather humourless
group. Frankly I feel that anyone who is offended by anything
he says is thin-skinned, takes himself and the hobby far too
seriously and has too big an ego to realize he/she is under the
illusion of being too self-important.

>It saddens me to think that within the brotherhood of ham radio there

I have an AEA PCB-88 TNC connected to COM3 and IRQ5. I am running Windows95 and I am having a problem with the TNC dropping characters.

It works fine under DOS but after the first 2K or so of data my TNC starts to drop characters big time.

My main terminal program is Procomm Plus 2.11 for Windows, but I have also tried it with Hyperterminal and have had the same problems.

Any ideas?

Thanks!

Ax

3421. HELP:> xNOS & Windows...

* Ham Email: G0RTX@MTLGW.AMPR.ORG (or mirror) G0RTX@SUGARLAND.AMPR.ORG
<**> Help me sort personal mail by adding G0RTX to the subject field

Hello everyone,

I have just got JNOS up & running with the simple Baycom modem. A very big thank you to all those OMs who helped with tips & advice...

For those who wonder how to go abt it, here is the procedure:
1: Load AX25 (Baycom driver)
2: Load SHROOM (Memory managing module)
3: Load JNOS (Version compiled with "PACKET" routine)

Well, now I am trying to go one step further and get the JNOS program and Windows-based network applications such as WinSock, WS_FTP & Netscape to port correctly. If someone has already tried this successfully, I would like to hear how it is done & what modifications/drivers were used for this. Config and batch files could make life easier for me if you send along with your tips & hints.

Thanks once again to all those who helped me in getting JNOS running.

73s from Ravi.

Try dropping the TBAUD to 4800. I think the PCB88 only had a 8250 with
no buffering.

In article <4qgsen$lbb@nuacht.iol.ie> ei7gm@iol.ie (Paul Kearney) writes:
>
>But when you first discovered radio , which mode did you find out about
>first ?

AM of course.

WLS "Sunday, Sunday, Sunday"
WSB "Welcome South Brother"
WHO "Border to border and coast to coast, and then some"
WSM (home of the Grand Old Opry)
WWL "from high atop the Roosevelt Hotel, New Orleans"
XERF (with Wolfman Jack wailing through the static)
CFL "the voice of labor" (Detroit)
WBZ (Boston)
WOWO "wonderful WOWO" Ft. Wayne
WFAA/WBAP "WFAA Dallas <click> WBAP Ft.Worth"
(they swapped frequencies at midnight)

I expect most of us got our first exposure to radio via AM.
Some of you youngsters may have started with FM, "no static
at all".

For many of us, our first exposure to amateur radio was while
tuning across the "world bands" on the old console radio in
the living room and hearing ordinary people talking to each
other (on AM of course). There were some thumping noises too,
but we ignored those.

Gary

At least there is black something re: ham radio. Because we sure do not welcome black people. Hams humourless?? Surely you jest. Can't you hear all the HI HI HI HI's? Hams are a real hoot.

I laught at myself and I accept a good shot in good humor but I am an Atypical ham.

<**> Help me sort personal mail by adding G0RTX to the subject field

Hello everyone,

I have just got JNOS up & running with the simple Baycom modem. A very big thank you to all those OMs who helped with tips & advice...

For those who wonder how to go abt it, here is the procedure:
1: Load AX25 (Baycom driver)
2: Load SHROOM (Memory managing module)
3: Load JNOS (Version compiled with "PACKET" routine)

Well, now I am trying to go one step further and get the JNOS program and Windows-based network applications such as WinSock, WS_FTP & Netscape to port correctly. If someone has already tried this successfully, I would like to hear how it is done & what modifications/drivers were used for this. Config and batch files could make life easier for me if you send it along with your tips & hints.

Thanks once again to all those who helped me in getting JNOS running.

73s from Ravi.

>73,
>Jerry KE6UUX

Jerry, you might want to take a look at the Kantronics KPC-3 also.
It' small, will run off a nine volt battery, and is a good companion
for a portalble computer and HT. It's been a few years since I bought
one, but I think they were around $110. We've had on on the air here
as a club packet node for about 4 years with no problems.

Security, no. You enter your callsign as a TNC paramater, and when
you connect to a BBS, the BBS know who you are by your call from
the TNC. Each packet sent will contain your call and the call of the
station you are trying to connect to or are connected to. Packet
BBS's usually don't require passwords, on radio ports. Some do on
LL ports. Yes, anyone who has a TNC on the frequency you are on
can see everything that you or any other packet station sends. Thats
not a problem, that's normal.

73, Jim KH2D

Most net-people know that Hams are sensitive to this issue. For
whatever reason, some people take things personal, or want to change
the world. You get the same attitude from uterus-fanatics, and
anti-jewish Southern Baptist club. Things will be smooth for awhile,
and then some net-person will mention the CW word in disrespect, and
the result is about two months of babble about nothing. But then most
Hamfests today are babble about nothing. It's really sad how the
hobby has changed since the 70's. It's not the mode of communication
that we should be worried about, it's the stagnation. Hams cannot
justify their existance if the continue to honor those who use SSB,
NBFM, AM or CW. Anything that uses those modes should be deprecated.

That's why I'm giving up on Ham radio, and the poor ARRL leadership.

About the only thing Hams can be proud of is the work done by TAPR and
the Hams involved in Spread-Spectrum. Everything else is a joke.
Contests? What a crock. SSB? what a crock. NBFM? same.

It won't be long before Part-95 attracts the most youth.

> There seem to be two sub-threads running through this whole thing,
> namely one questioning the need to mandate Morse and one wanting
> to make Morse obselete.

Almost a cogent analysis: most of the supporters seem to fear that
cries of "obsolete" with regard to de-mandating Morse will lead
quickly to forbidding Morse.

We are allowed in this world to have things that are neither mandatory
nor forbidden. If Morse code has such great advantages as claimed, it
will not die out if no longer mandated. If it does die out, the claims
were overstated.

Make it obsolete? It is obsolescent everywhere outside our bands, with
the possible exception of ELF, and I think even they are mostly
robo-digital. It is already obsolescent in spite of still being mandated.
We don't need to MAKE it obsolete. Time alone takes care of that.

Damped Wave (DW) emissions are forbidden, for good reason.
There is no pressing technical reason to forbid CW emissions with the
Morse encoding of On-Off-Keyed modulation. (Although there are technical
reason to forbid AM emissions, due to their atrocious bandwidths and
heterodynes, even that will not happen.)

Why should I be required to pass a code test to operate HF Phone on 75m
for reaching beyond my local VHF area within the state but not to
operate CW on either 6m DX or the VHF-uplink to an OSCAR with a 10m
downlink and potentially international coverage (especially once Phase
3-D is up there)? The relevance escapes me. I say it's an absurd
anachronism that gives our Service a public relations black-eye.
(The looks I get when technically adept people hear the repeater i.d.
in Morse! Anti-deluvian!)

> While I am as much against government interference as the next guy,
> I have a hard time objecting to the requirement to learn something
> that is easy ...

Easy for whom? Certainly it is easy for anyone who has done it. There
are people who have tried and tried hard and CAN NOT LEARN MORSE.

In the old days, they just let their Novice ticket expire when they
couldn't break the 10wpm barrier. Now you can meet a few on the VHF
repeaters, since there is something else to do in the A.R.S.

(Amateur Radio Service).

In the days when CW was king and AM-phone was unreliable and SSB was
a novelty, it made sense to just ban these people from the A.R.S.
Now-a-days, it's not really advisable to strap a key to your knee when
mobile, although I have heard of a few 55wpm/55mph QSOs recently.
If someone has something to add to the A.R.S. inspite of being unable to
learn Morse code, should they still be banned from the A.R.S. in the current
state of technology? I say not.

Are there people who CAN NOT LEARN the code? Yes. Case it point:

My father flunked morse code class in the Army -- working on it and radio
intercept operations training full time for several weeks -- TWICE
(maybe three times, as a teacher he accepts that his "pass" the third
time was an early example of "social promotion"), knowing that if
he didn't get the rating he'd be carrying a rifle to Korea (where they
had a shooting war going on). That's motivation, he's bright, has a
good ear (for music), but he didn't make it. After being "graduated"
while still incompetent, he was assigned rotations at an army listening
post in a nice safe location, where supposedly copied morse on a mill,
but in reality did all the scut work (broom-and-coffee chores) for his
watch while the other guys did the mill-work. Lucky for him it was a
large station... if they hadn't had 8 hours of scut-work, the C.O. would
have had no choice but to send him to Korea.

> and has been useful in the past

True, but irrelevant. Damped Wave Morse-code (that which CW is in contrast
to) was once useful and is now unlawful as well as obsolete. Although
I don't propose outlawing CW/OOK/Morse, I find it's former usefulness
irrelevant.

> Again, I must point out, it takes more
> time for me to respond to these posts than it does to do a Morse drill.

True, but the debate is much more useful. We might actually save
our A.R.S. If the Little LEO consultants were to play up that the
Core Membership of the ARRL thinks that HF Morse Code is current
technology, they could win in the court of public opinion. And to
win against the Little LEOs, the ARRL needs the voices of support of
the Scummy-No-Code-Techs they've been ignoring. Luckily the threat
comes to the bands most used by these undesirable, so they're
interested. But after this tempest in a teapot dies down, the ARRL
will need to keep these newly politicized hams happy...

> - As Gary has mentioned already, digital modes come and go (re RTTY).
> What is today's hottest mode may be tomorrow's obsolete trash.
> Morse, on the other hand, is everywhere on HF and has been there
> for a long time.

Should we all be operating AM instead of upgrading to SSB because
of the sunk investment cost?

Are you saying RTTY is more obsolete than the straight key and
ear-copied morse code? With a straight face?

Since so-called CW (OOK modulation, /Morse encoding) does less harm
than say 6m-AM, we need not ban it. But the fact that every ham
currently active on HF knew it once and probably is still equipped
physically for it is irrelevant for whether we should mandate continued
testing and training.

> Thus, there is quite a world wide investment in the
> necessary equipment.

This contradicts it being a cheap mode ...

> - If a digital mode is not an option (ie, the other guy can do only
> phone or Morse), Morse cuts through more easily than phone.

CW gets through better than SSB gets through better than AM.
So what? If he can't or won't do modern digital and I can't or won't
do original digital, either we'll talk later when we can get through
on SSB or someone else will work him.

> - Being able to read and write a foreign language is one thing, being
> able to speak it is another thing entirely

True. However, CW is not the only mode besides SSB, contrary to the Old
Buzzards.

There's no reason (aside from the silly ARRL recommendation) not to use
the same prosigns used in international morse QSOs on international
RTTY/AMTOR/etc modern-digital QSOs. They work. They'll work for any mode
except SSB.

> If you're not interested in talking to foreigners, then why do you need
> HF, when you can use repeaters and Oscars and TNC's and PC's for
> all the local and national coverage?

HF voice, CW, and data are useful for inter-region intra-national comms,
particularly for emergencies and emergency drills (like Field Day).
And to be ready for emergency, we need to practice. (I hate to think
of this as an excuse for the misogynist lid nets on 75m... :-)

This is usually where people say CW has the emergency advantage over
modern digital that they don't need a computer that runs of the AC
mains to send and copy CW/Morse/OOK. How many people really need
AC mains to run their computers anymore either? Our Field Day site ran
all its computers (mostly running CT) off the emergency power generator
like they would in a sustained emergency, and in the HF tent, most were
laptops capable of running on battery longer than the transmitter would
have. My pocket "calculator" has an RS232 port; if I wanted to, I
could add a pocket-TNC to my backpack and be survivable digital portable.
The days of RTTY being non-survivable are OVER.

(And besides, with all the robotic keyers out there, the ARRL has instituted
Straight Key night. I wonder how many CW stations are actually survivable

in normal operating mode...)

(The argument that "All HF hams should have a mode in common" made sense when there were fewer hams. I suppose we all should recognize ... --- ... even if we can't copy code, just as we all should recognize Mayday! even if we can't speak French, so that we can at least clear the channel or maybe try to raise a relay station if we can't help directly. But if we're worried about Band Crowding if all us Scummy No Coders get onto the HF bands, I don't think one can also argue that What if The No Coder is the only one listening when The Call comes? if s/he's the only one listening, then it's not too crowded.)

> In my book, there is another advantage to CW. It is:
> - For the home brewer, tackling a CW TX is a much simpler entry point.
> If Morse were to disappear, how many adults (let alone kids) would

As Gary has repeatedly has said, one more component and it's FSK (at least on the transmit side; how about RX, Gary?). And the desirable interface circuit will be no more complex than the Curtis Keyer you'll quickly add to the CW version of the project. I can imagine building a dual-mode FSK/CW TX with RS232 and Curtis-Keyer interfaces, and don't see the point in NOT doing so if I do scratch-build anything...
I've also heard WBFM is easy enough, why bother with FSK.

Who says anything about MORSE disappearing? CW/Morse is no where near as harmful as DW/Morse was, we don't need to ban it. A CW TX is a nice project. I may build one. I may even build it on a band where Morse tests aren't required. As a Tech- licensee, I'm licensed to build and operate CW TX's on 6m and 10G and every ham band in between, with no code test required. So why do I need a test for 10m? Because the IARU requires to FCC to require it.

Most net-people know that Hams are sensitive to this issue. For
whatever reason, some people take things personal, or want to change
the world. You get the same attitude from uterus-fanatics, and
anti-jewish Southern Baptist club. Things will be smooth for awhile,
and then some net-person will mention the CW word in disrespect, and
the result is about two months of babble about nothing. But then most
Hamfests today are babble about nothing. It's really sad how the
hobby has changed since the 70's. It's not the mode of communication
that we should be worried about, it's the stagnation. Hams cannot
justify their existance if the continue to honor those who use SSB,
NBFM, AM or CW. Anything that uses those modes should be deprecated.

That's why I'm giving up on Ham radio, and the poor ARRL leadership.

About the only thing Hams can be proud of is the work done by TAPR and
the Hams involved in Spread-Spectrum. Everything else is a joke.
Contests? What a crock. SSB? what a crock. NBFM? same.

It won't be long before Part-95 attracts the most youth.

FREE?? Tell me how!

I've bought ready to run ham rigs and other equipment.
Free? Far from it!

I've rebuilt commercial equipment I got for a lick in the face.
Needed 2 new x-tals and a box. Free! No, just cheaper.

I've built equipment from scratch. Pity scratch is so expensive.
The result was not much cheaper than buying it. Component prices
really adds up before you have a working box. Free? Nope!

Club fees: xRRL, Local chapter, Packet group,..... $$+$$+$$
(for what services?)

Programs: I've been looking for (software) projects, but wouldn't
like to start from scratch. So I've been looking for open software
that I can add on to to get the functionality I want. Open _what_?
Can't even _buy_ it as a toolbox. Seems to me almost everything
that has to do with packet and sattelites is closed as a clam.
Buy it and use it as it is only. "No user serviceable parts inside".

I've never had the feeling I (and my wallet) have been so
thoroughly milked before. And that says something, as I
also have fast Italian cars as a hobby. Can't say I expect
much change if Billy boy opens the Gates to HamRadio.

Did you know that there are Bulletin Board Systems (BBSes) that are oriented toward amateur radio? Well, there are quite a few of them and we are adding new listings all the time.
To find out where they are located, point your web browser to: http://www.vni.net/thedirectory and go to the "search engine." Enter the words "amateur radio" (and in a different search enter "ham"). It will return a list of area codes where the boards are located. Click on the links to go the individual area code listings.
Remember to return about once a month as we regularly find and list new boards devoted to amateur radio. There are also BBSes devoted to a wide variety of other topics that you may find of interest.

You can make a whip from just a 19 inch length of wire and a coax
connector, IE take a PL-259, solder the wire to the center pin,
and slip a piece of shrink wrap down over it so it can't touch
the outer wall of the connector (filling the cavity with epoxy
is even better). However, for mobile use you really want something
other than copper wire. It would be deformed with every tree branch
impact. What you want is copper plated music wire, with perhaps
an anti-corrosion nickel overplate. That's what commercial whips
are made of. Fortunately, these are cheap. You can get replacement
whips from many sources, often for only $2-$4. You can similarly
solder these whips into a PL-259 if you sand down to the copper
plate first. Your mount is just a SO-239 fixed to a plate attached
to a magnet.

There are enough variables in antenna mounting to make a ruler
measurement insufficient. You really need to borrow a meter to
trim the antenna on frequency. However, the HT is fairly insensitive
to SWR (since it usually has to work with a rubber duck which may
have a wildly varying SWR depending on how and where you are holding
it). So the antenna will work even if you don't trim it exactly to
frequency.

3449. Baycom Users?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-01 00:00:00 UTC
From: 71674.16@compuserve.com
Message-ID: <4r93fu$qaa@star.epix.net>
Source record: 36053

I have a query for any experienced Baycom users out there.

I have used the Digicom program for the C64 (precursor to Baycom) and it did true DCD, so that you could run your squelch open all the time.

I've now got Baycom v1.4 and the docs say to run with squelch closed. My HT does a battery-saver routine whenever the squelch is closed. This is murder on packets! Is there a version of Baycom that does true DCD?

BTW, my modem is a Baypac BP-2, my PC is an HP200LX, my HT is a Yaesu FT-23R.

Any advice much appreciated. 73.

>that says 2m has to be reserved for end-point data communications only?

Not from the FCC. They don't distinguish between end user stations and
backbone stations. A transmitter is a transmitter as far as they're
concerned. Now the OO may have been complaining about out of *bandplan*
operation. Local areas have bandplans, and the frequency chosen may
not have been approved for backbone usage in that area. That would
make it a violation of "good amateur practice" if a backbone were
placed on a channel the local bandplan said was for a different use.

2m is still very much used for backbones in many areas. 145.01 MHz
is still THE backbone for many packeteers (and the APRS and Packetcluster
boys have squatted on other frequencies such as 145.75 MHz in some
areas). That's all basically legal, though it may not be in conformance
with some other people's bandplans. Putting a backbone on 146.52 MHz
would certainly be against almost everyone's idea of a bandplan, however.

Backbones work best when no user stations share the channel, so most
bandplans have frequencies set aside for them. In general, UHF and
above is a better place for a backbone, because speeds can be higher,
and there is more available spectrum on which to find a semi-exclusive
channel. However, topology and propagation may make 2m, or even 6m,
a better backbone choice in some cases. In any event, usage should
attempt to conform to local bandplans when possible, especially when
usage will be heavy and continuing such as is the case for a backbone.
Only if the local bandplan is inappropriate should it be ignored, and
even then it is better to work with the bandplanners to get it changed
rather than just bulling ahead. We have to live with other spectrum
users, and they have to live with us. It's better if we can do this
cooperatively rather than competitively.

What's the definition of an 'unmoderated INTERNET link' ? Being involved with Internet gateways longer than the majority of the people here have even heard of the Internet, there is no such definition. The FCC also could care less about it too, from feedback that I've gotten they think the gateways are pretty cool and have nothing against them. Hams know what is right and wrong and what can pass through, so message content isn't an issue and there have been very very few problems with the gateways.

Illegal messages on the AX.25 BBS's.... now that's a problem.

: that says 2m has to be reserved for end-point data communications only?

Geez... who's the OO that cited the person, George? There is nothing wrong
with using 2m for linking, in fact there are regular user frequencies
that links stay away from and there are other frequencies that users
stay away from because they are used primarily for linking and forwarding.
People wonder why packet in Michigan is so bad and why I packed up all
my equipment and gave most of it away, it has to do with people that have
nothing better to do in life than try to interpret the rules themselves
and send out notices when it is clearly the OO that is wrong. If you
know who the OO is feel free to give him my name and call and tell him
that I said that he is wrong and I can prove it.

You'd also be suprised how many people said I operated illegal years ago.
I ran compression before the BBS programs had it (everyone said I was
illegal because of it), then I put up an Internet gateway in Detroit
and I was supposedly illegal for that too. When you are the exception
to the norm people get scared and will rather attack you than work with
you. I always jumped in and called people out and attacked right back,
that's why people typically backed off of me pretty fast when they said
I was illegal when I knew I was not. If someone threatens you when you
are doing nothing wrong just call them out and tell them to go to
hell and they'll usually get scared enough to back off pretty fast.

Funny too that everything that I did that was supposed to have been
illegal is now fully legal and is being done all over the country. Also
no laws have been changed either changing anything. You just happen to
live in the wrong state when it comes to packet radio.

In talking with some other digital ham radio people in my county (as part of the planning process for putting in some digital services to get better coverage of the county), he said that somebody else in the area who had been using a 2 meter frequency as a backbone link had gotten a pink ticket from an OO.

What's going on here? I looked through the most recent version of Part 97 I could find, and the only restriction for data on 2 meters I could see was a bandwidth/baud rate limitation. Is there some kind of restriction in place that says 2m has to be reserved for end-point data communications only?

In general, I'd stay away from "user" (2m) frequencies for backbones, especially in metropolotin areas. Besides using a resource many are competing for (on 2m), you'll also have alot of users trying to hack your link. If you must use 2m, go horizontal and reduce your power.

Was suprized (amazed?) that a OO would cite you for that however... but then I checked the callbook server and saw you were in Michigan.

3461. Need INFO, EVERYONE PLEASE READ!!

Howdy..

I have a few Questions...

I need info on building a Mobil Mag mount antenna for my Truck to use with my HTX-202..

I have been given some advice, but i am looking to build something cheap but looks NORMAL, someone told me to use a coat hanger, etc ..

I have 12 guage wire i can use, but need a little info, what length should i cut it at, to use it at 145.470 (local Repeater) I dont have any kind of swr meter or anything but my radio which will let me know when its pumping out full power...

any help will be most apprecaited (text files. urls. graphics, drawings , etc,, attach then to a e-mail please!!)

ALSO

I am looking for some ham mailing lists.. i am starting one for my areas repeater.. (for the members who have e-mail accounts..) and would like to join a few and echo some good info etc...

Please let me know how to subscribe to those..

THANX!!!

It's a fair bet that he was chastised for operating an unmoderated
INTERNET link, which generally does NOT comply with FCC rules unless the
message content is strictly monitored and non-amateur traffic is removed
by the SysOp / amateur radio licensee. It's also considered very poor
practice to use a 2M freq for backbone (high traffic density) operation
since it is almost impossible to share the frequency with other hams in
the area.

I run my PK88 at 9600, under DOS OK, also, but you should definitely
check flow control, and make sure its set for RTS under W95,
and that you have a fully wired modem cable
which supports RTS/CTS.

KAWIN NEWS

KaWin 6.39 is ready for download! Minor changes to the help file too.

KaWin 6.39's enhancements are largely focused on the HF CW or RTTY operator, but there are some minor fixes that will be welcomed by all. They are described in the Squawk file.

HF DX and contest operators will find a competitive advantage in the new option to send every keystroke as it is pressed, and those with access to a DXCluster will be one click ahead of the gang when a new spot appears by clicking on a DX spot and instantly setting the callsign in the HF context. Also, the automatic logging of HF QSOs in non-connected modes is now subject to operator confirmation - no more log entries for unsuccessful DX calls.

All currently reported bugs are fixed in 6.39.

This is NOT true. Bill Gates and Craig McCaw were founding investors in a company called Teledesic. Teledesic is getting allocations at 28 GHZ for high speed satellite data access (digital voice, video, internet data, whatever - its all bits). They have no involvement that I am aware of in LOW earth orbit (LEO) satellites for 2-way short messaging of the type that the LEO providers wish to offer.

I am an employee of Microsoft Corporation and the above statements represent my personal opinion and are not necessarily those of my employer. Besides who else would ever accept credit for my silly opinions?

First off, Microsoft is not involved in Teledesic.Teledesic
is a private investment of Bill Gates. Bill Gates and Craig
McCaw were founding investors in a company called Teledesic.
Teledesic is getting allocations at 28 GHZ for high
speed satellite data access (digital voice, video, internet data,
whatever - its all bits). They have no involvement that I am
aware of in LOW earth orbit (LEO) satellites for 2-way short
messaging of the type that the LEO providers wish to offer. Microsoft
does not have a "private constellation of satellites". We write
software, remember?

Someone said that the Amateur Radio forum was kicked off MSN. I'm
not involved in MSN so I can only speculate. But realistically, what
does MSN add to Amateur Radio forums? There is plenty of chatter
here in the newsgroups and several hundred web sites devoted to the
web. Seems to me that in MSN's already announced intention to convert

to a web-based online service (whatever that means) they are probably disgarding a number of features that are handled better elsewhere on the web.

I am an employee of Microsoft Corporation and the above statements represent my personal opinion and are not necessarily those of my employer. Besides who else would ever accept credit for my silly opinions?

Dear Gary,

Check out the article on the "Steath" antenna reviewed in this month's
CQ Magazine. I wouldn't say it's indestructable, but it's the best so
far.

>OO.

Rule #1 : Throw all OO notices in the garbage. The average OO and the
entire ARRL have no idea what the rules are nor do they care. You are
simply doing something to advance Ham Packet Radio and the ARRL does
not want that to happen.

>What's going on here? I looked through the most recent version of Part 97 I
>could find, and the only restriction for data on 2 meters I could see was a
>bandwidth/baud rate limitation. Is there some kind of restriction in place
>that says 2m has to be reserved for end-point data communications only?

Rule #2 : See Rule #1 above.

You are 100% correct. All you need do is meet the Part 97 limits for
bandwidth, baud rate, and digital code used and you are fine.

My sugestion is to just ignore the OO notices and stay within the
rules, NOT what the ARRL wants.

You could, of course, send the notice to the FCC and a few
Congress-Critters and demand the so-called Amateur Auxilary be held
accountable for their actions. Even more, you could sue the hind legs
off the ARRL and the particular OO in question.

Maybe that would teach them how to read the rules, but I doubt it.

Take Care & 73

I am trying to build an FSK modem for use on 2M packet, but the plans I have calls for a TI TCM3105 FSK modem chip.

I have contacted all of the component suppliers that I know but am unable to locate this chip (is now obsoulite). The one exception had a minimum order of 20 pieces.

Alternatively, I am able to aquire either a Motorola MC14412 or a MC6860, but cannot find the data sheets for these chips.

If anyone can help me locate any of the above item, I would greatly appreciate it.

I am doing an article on the BP-2 and the HP200lx for Palmtop Paper.
You will need to find out how to turn off the batt saver routine. Most
radios I know of have a BATT bottun to toggle it on and off. Or a SAVE
bottun. Both my HTX-202 and Alinco DJ-F1T have it. I have heard
rumors of it being bad for the radio anyway to run 100% duty with the
squelch open. Just "dont" do it.. Ill also add that i like version
1.5 better. as the text bugs are fixed. I run it on my palmtop and my
notebook now. Some advice, take advantage of modifying the termhelp
file to see frequent pbbs commands etc.

:h tcp shows tcp/jnos bbs commands quicker than waiting for the bbs help
:h bbs shows packet frequencies and their local bbs's for my area.
:h mail shows my regular QSOs and their packet address
you get the idea.

>

>It's a fair bet that he was chastised for operating an unmoderated
>INTERNET link, which generally does NOT comply with FCC rules unless the
>message content is strictly monitored and non-amateur traffic is removed
>by the SysOp / amateur radio licensee.

Sorry, but that's a bet you would lose. As it happens (I got some later
information), the link in question carried CONVERS traffic to another part of
the regional network. So, it wasn't unmoderated Internet traffic.

>It's also considered very poor
>practice to use a 2M freq for backbone (high traffic density) operation
>since it is almost impossible to share the frequency with other hams in
>the area.

As was pointed out to me in email, this is possible, but depends a great deal
on circumstances. In some parts of the country, 2m may well be full, but that
does not apply everywhere.

I don't believe the TCM3105 is obsolete. Texas Intruments still makes them and they are available through Allied Electronics for about $9.00 each according to their latest catalog #956. The only catch is have a minumum order of $25.00. Phone 1-800-433-5700 or check out thier parts lookup for prices and stock at http://www.allied.avnet.com.

Good luck.

>the planning process for putting in some digital services to get better
>coverage of the county), he said that somebody else in the area who had been
>using a 2 meter frequency as a backbone link had gotten a pink ticket from an
>OO.

Rule #1 : Throw all OO notices in the garbage. The average OO and the
entire ARRL have no idea what the rules are nor do they care. You are
simply doing something to advance Ham Packet Radio and the ARRL does
not want that to happen.

>What's going on here? I looked through the most recent version of Part 97 I
>could find, and the only restriction for data on 2 meters I could see was a
>bandwidth/baud rate limitation. Is there some kind of restriction in place
>that says 2m has to be reserved for end-point data communications only?

Rule #2 : See Rule #1 above.

You are 100% correct. All you need do is meet the Part 97 limits for
bandwidth, baud rate, and digital code used and you are fine.

My sugestion is to just ignore the OO notices and stay within the
rules, NOT what the ARRL wants.

You could, of course, send the notice to the FCC and a few
Congress-Critters and demand the so-called Amateur Auxilary be held
accountable for their actions. Even more, you could sue the hind legs
off the ARRL and the particular OO in question.

Maybe that would teach them how to read the rules, but I doubt it.

Take Care & 73

In my opinion, ham radio will show a true decline when the FCC agrees to let our allocated sections of the spectrum to other uses.

Bottom line - we live off the spectrum. When that's gone, we're gone, unless we can re-engineer the hobby to complement today's needs.

3499. Is HAM Radio Really Dying ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-03 00:00:00 UTC
From: Hiatt <hiatt@flash.net>
Message-ID: <31DB2754.7D5A@flash.net>
Source record: 36004

Now, no one chatize me for this, ...

BUT ....

If you've seen (or about to see) Independence Day (the Movie) HAM Radio & CW seem to save the day. After all other forms of communications have failed or are unreliable, the message seems to get around the country that the U.S. has a plan that might save the planet.

Unrealistic .... the fact that we'd be able to fend off an interstellar attack.

Realistic .... the fact that HAM radio might be useful IF all forms of communications do fail.

Just the fact that HAM Radio is EVEN mentioned in a movie is very pleasing to me !!! Let alone save the world !!! To think, someone actually knows that it exists.

Of course, if we had these local and DX bands taken from us, it woudn't do much good. Don't totally compare this to the movie though. Use your imagination in what could happen (i.e. earthquake, tropical storm, tornado, war ?!?) More than likely, ARS operators are capable and willing to help there country (maybe world, depending on the situation) when all other ways of communicating are down.

From: ke6mgb@ix.netcom.com
Message-ID: <4rctbt$jqq@sjx-ixn4.ix.netcom.com>
Source record: 36091

Hi,
I am looking for a 9600 Baud TNC, and a 440 or 2M radio, capable of
doing 9600. If you are selling, please tell me. I am looking for a VERY
low price.
Thanks....
Rod

3501. Backbone data on 2M - against the rules?

Newsgroup: rec.radio.amateur.digital.misc

PR>In talking with some other digital ham radio people in my county (as part of
PR>the planning process for putting in some digital services to get better
PR>coverage of the county), he said that somebody else in the area who had been
PR>using a 2 meter frequency as a backbone link had gotten a pink ticket from a

PR>OO.

PR>What's going on here? I looked through the most recent version of Part 97 I
PR>could find, and the only restriction for data on 2 meters I could see was a
PR>bandwidth/baud rate limitation. Is there some kind of restriction in place
PR>that says 2m has to be reserved for end-point data communications only?

PR>--
PR> ...phil

Phil,
Sounds like they are trying to tie it in with having voice links
and the rules state they should be at 220 Mhz and above. I am a
coordinator for Digital here in Az and we coordinate backbone radios on
2m. I have yet to see any rules that state that it is an incorrect
practice. Digital is NOT the same as Voice links. Have him put some
users on the freq, then it is no longer a backbone. That will quiet the
OO down.

This is the time and place to push for a new data sensitivity measurement: Manufacturers of amateur digital mode equipment should quote digital sensitivity at specified Bit Error Rates (BER) of 1 per 10^4 and 10^6 when used with a "standard" or "reference" modem/TNC.

Commercial SCADA operations folks seem to feel that 1 error per million sent is acceptable for non-error correcting protocols, while 1 per ten thousand is OK for protocols which detect or correct errors. Data radio users should insist on the BER measurements for radio + TNC as a package. Ignore the 12 dB SINAD analog voice numbers - they mean absolutely nothing for digital DFM modulation.

The FCC and commercial world know that 12.5 kHz BW is enough to run 9600b data. Performance of commercial 950 MHz SCADA transceivers running both analog FM & digital carrier shift keying (Direct FM) with 12.5 kHz receiver bandwidth and identically modulated adjacent channel rejection -40 dB at 12.5 kHz is as follows:

Mod Type/Rate	Method	Decoded Sensitivity	Relative Performance
Analog 1000 Hz	12 dB SINAD	0.3 uV	-145 to -149 dBW baseline value
1200B 202 (VHF Pkt)	10^4 BER	0.6 uV	-140 to -143 dBW needs 6 dB more RF
4800B DFM 2 state	10^6 BER	1.2 uV	-140 to -142 dBW needs 6 dB more RF
9600B DFM 3 state	10^6 BER	1.6 uV	-136 to -139 dBW need 10 dB more RF

Note the 6 dB speed/signal penalty when running 1200b AFSK instead of direct carrier shift FM at 4800b, just as the communications theory textbooks predict. It's also time for hams to start conserving the spectrum locally allocated for packet, so that more stations can be on the air in any given locale. On other bands and with higher local ambient

noise levels YMMV, but you must always use the proper end-to-end decoded
sensitivity numbers to compute the link budget.

Yeah, right. Why can't you just assume that perhaps this is the action of
a misguided OO? You think that the ARRL sits in Newington thinking about
ways to make life miserable for people? That's cute!

One thing that amazes me about this thread is that I do not recall seeing
exactly what the OO notice said. Are we all SURE that the warning was for
using a "backbone" on 2M. Is that what it said? Where was this backbone?
146.52MHz? 144.200MHz? We don't have all of the facts (or at least I have
not seen them) so how can we jump to conclusions.

> bandwidth, baud rate, and digital code used and you are fine.

Not true. You also have to meet the limits for message content. Plus the
FCC has generally considered it not right to go against standard Amateur
practice (ie. no packet on 146.52 please!).

> My sugestion is to just ignore the OO notices and stay within the
> rules, NOT what the ARRL wants.
>
> You could, of course, send the notice to the FCC and a few
> Congress-Critters and demand the so-called Amateur Auxilary be held

> off the ARRL and the particular OO in question.

Yeah, that will make things better. If this OO sent out a notice based only on the fact that backbone traffic was being sent on a 2M frequency, then that OO needs to be informed about the rules. Try sending him/her a letter and send one to the ARRL as well. This is all assuming that other factors (frequency, message content, etc. do not play any part in this).

Yeah, sue every Amateur volunteer for everything their worth. That will make Amateur Radio better.

BTW, the club I belong to got an OO notice several years ago for operating too close to a band edge. Turns out they were very much right. We found out who had been operating at that time based on the log and made them more aware about the bandwidth of a SSB signal. We appreciated the reminder.

> Maybe that would teach them how to read the rules, but I doubt it.

I think we ALL could stand to reread the rules now and then.

Jeez, why so aggressive? I don't mind being told that I am violating the rules, so long as it's actually a rule violation, and not a violation of what somebody interpets the rules to be. If they can't cite chapter and verse to me, then I suspect I'd ignore it too. But, I'm not so violently opposed as to reject it out of hand.

Thanks for reading this..

I am wanting to upgrade the mailbox on my older KPC-3 TNC and am trying to locate a source for these 512K X 8 Static ram chips that supposedly can be used in the KPC-3.. I called a computer memory retailer and was advised that they have a "pseudo 512k x 8 ram chip" but they do not have regular static ram chips.. the sales person stated that the pseudo chip required battery backup to retain the contents of the memory, while the normal ram chips did not.. Now to my questions..

Does anyone know if these pseudo 512k x8 ram chips will work in the place of the regualar 512k x8 static ram chips??

Does anyone know of a source of regular 512k x 8 static ram chips..

Any and all comments will be welcomed..

Thanks Don AE4BR

I'm not sure he is advocating this. The problem is that mis-informed
people (or worse... crackpots, vigilantes, etc) are being appointed
OO's and into the amateur auxilary. Should one not have any recourse
should these 'appointees' overstep there bounds?

BTW, the ARRL once again is trying to shield the amateur auxilary
from lawsuits using the power of Congress. The House Resolution
proposed would make the amateur auxilary "Federal employees only
for the purposes of chapter 171 of title 28, United States Code".
In other words, you sue a OO, they are defended by the Federal
goverment at your expense. Check out H.R. 3207 which is currently
before the commerce committee. (Its on http://thomas.loc.gov).
In *theory* I think it *might* be a good idea but until the ARRL
is willing to tighten the OO/AA program up, there is no way I
could support something like that. I also have a serious problem
with the FCC abrogating their responsiblity to enforce the laws
to the ARRL or any other special interest group. But I digress.

I think this question is more like the "screaming fire is a
crowded theater". Can I operate a backbone on 2metres? Yes,
should I? Likely no depending on the circumstances.

******* U.S.A. QSL BUREAU **********
****ANNOUNCES NEW LOWER RATES****
ANNOUNCES EXPANDED DX QSL SERVICE

NOW "QSL VIA USBURO"
A QSL BUREAU FOR DOMESTIC U.S.A. QSL CARDS, ALL 10
DISTRICTS, TERRITORIES AND TRUSTEESHIPS OF THE U.S.A.
NOW A QSL BUREAU FOR ALL YOUR OUTGOING DX CARDS TOO!

DEAR FELLOW HAM,
"THE FINAL COURTESY OF A QSO IS A QSL", BESIDES BEING
ONE OF THE OLDEST QUOTES IN AMATEUR RADIO, IT IS ALSO
OUR TRADITION!

AS POSTAGE COSTS HAVE CLIMBED TO THE CURRENT 20/32 CENTS
FOR CARDS/LETTERS, THE USA QSL BUREAU WAS CREATED BY HAMS
FOR HAMS, TO PROVIDE AN INEXPENSIVE ALTERNATIVE TO THE
HIGH COST OF POSTAGE! ALLOWING ALL OF US THE ABILITY
TO CARRY ON THE TRADITION OF SENDING A QSL CARD FOR ALL
OUR STATESIDE QSO'S.

TO BE SUCCESSFUL, AND FUNCTION PROPERLY, ALL OF US MUST
PARTICIPATE. IT IS OUR SINCERE HOPE AND THE SINCERE HOPE
OF THE HUNDREDS OF YOUR FELLOW HAMS THAT ARE CURRENT USERS,
THAT YOU WILL COME ONBOARD AND FURTHER HELP ALL OF US MAKE
THIS A SUCCESS. THE SAVINGS AND BENEFITS ARE YOUR!!

YOUR PARTICIPATION WILL HELP EVERY U.S. HAM TO ENJOY THE
ABILITY TO CARRY ON THE TRADITION OF BEING ABLE TO TO QSL
EVERY QSO WITH AN INEXPENSIVE ALTERNATIVE, WHILE SAVING
YOU AND EVERYONE OF US BIG BUCKS IN POSTAGE!

AFTER MANY REQUESTS FROM OUR CURRENT USERS WHO WANTED TO BE
ABLE TO "ONE STOP SHOP" AND MANY HAMS THAT ARE NOT ARRL
MEMBERS, WE NOW OFFER YOU THE ABILITY TO SEND ALL YOUR
OUTGOING DX QSL CARDS VIA THE USA QSL BUREAU.

THANK YOU
73'S
BILL-AA1MF-, YOUR FELLOW USERS, & USA QSL BUREAU STAFF

SEND ALL YOUR OUTGOING USA QSL CARDS VIA THE BUREAU
NEW LOW RATE FOR YOUR OUTGOING CARDS;
JUST $0.05 EACH REGUARDLESS OF QUANTITY,
THAT'S JUST $5.00 PER 100 CARDS, A REAL BARGIN!!

PRESORT ALL CARDS BY DISTRICT AND SUFFIX
(IE: W1A, W1B, W4A, W4F, W4G, W4H, W5A, W5C, ETC.)

PLEASE PUT CALLSIGN OF STATION YOU ARE SENDING CARD TO IN
THE ADDRESS SECTION (BACK OF CARD) IN 3/4 INCH LETTERS!!

NO CHARGE FOR CARDS SENT TO YOU BY THE BUREAU - PLEASE KEEP AT LEAST
ONE SASE ON FILE - BUREAU WILL NOTIFY STATIONS THAT HAVE CARDS WAITING
BUT DO NOT HAVE SASE'S ON FILE - ALL CARDS GET DELIVERED!!!

YOU MAY NOW SEND ALL YOUR OUTGOING DX QSL CARDS VIA THE USA QSL BUREAU
RATES FOR YOUR OUTGOING CARDS; $0.05 EACH REGARDLESS OF QUANTITY
YOUR ONLY REQUIREMENT; ALL OUTGOING DX QSL CARDS MUST BE
ALPHABETICALLY SORTED BY CALL-SIGN PREFIX (IE: AM, CE, CO, DL1, DL7,
EA, LH, OA, 3A, 5A, 7JA ETC.)
WE HANDLE CARDS GOING TO ALL IARU BUREAU S & COUNTRIES WITHOUT A
BUREAU BUT HAVE A QSL MANAGER OR OTHER ORGANIZATION AVAILABLE FOR THE
CALL-SIGNS BEING SENT.
A LIST OF COUNTRIES SERVED IS AVAILABLE FOR A SASE, OR BY E-MAIL.
YOU MAY USE -QSL VIA AA1MF- IF YOU PREFER TO HAVE ALL CARDS COME THROUGH
THE USA QSL BUREAU, OTHERWISE YOU WILL RECEIVE YOUR INCOMING DX CARDS
VIA YOUR CALL DISTRICT INCOMING DX QSL BUREAU. BE SURE YOU HAVE SASE S
ON FILE THERE.
A LIST OF INCOMING DX DISTRICT BUREAU S IS AVAILABLE BY SASE OR E-MAIL.

START ENJOYING THE SAVINGS AND BENEFITS TODAY!!
SEND US UP TO -4- #6-3/4(3-5/8 X 6-1/2) SASE's (ONE STAMP EACH)
PLEASE PUT YOUR CALLSIGN IN THE UPPER LEFTHAND CORNER OR SEND US $5.00,
YOUR CORRECT RETURN ADDRESS, & WE SUPPLY 10 SASE's FOR YOU.

SEND YOUR CHECK AND OUTGOING CARDS ALONG WITH YOUR SASE'S TO:
USA QSL BUREAU
P.O. BOX 814
BREWER, ME 04412-0814

DON'T DELAY! DO IT TODAY!
ENJOY THE SAVINGS & BENEFITS TODAY!
THE QSL CARD - THE FINAL COURTESY OF A QSO!!!

THE USA QSL BUREAU IS A NOT FOR PROFIT ORGANIZATION!
OPERATED BY AA1MF & CREW
E-MAIL TO:
AA1MF@AOL.COM
102452.2315@COMPUSERVE.COM

SHOULD YOU HAVE ANY QUESTIONS, PLEASE LET US KNOW!!
WE ARE HERE TO SERVE YOUR DOMESTIC & DX QSL CARD NEEDS!!

>">have any kind of swr meter or anything but my radio which will let me
>">know when its pumping out full power...

i guess one would want to get the most from any radio transmitter, but that
phrase about "pumping out full power" is very "CBish" - sounds like maybe
a refugee from the CB bands that hasn't been exposed to the idea that some
people actually have radios used for bidirectional communications instead of just
trying to "cover everyone up".

>"You can make a whip from just a 19 inch length of wire and a coax
>"connector, IE take a PL-259,

good answer -- tell the guy what he needs to know - i think my answer was
a pointer to the arrl handbook...

> Just a second...
>When we took the Ham test didn't we have to show that we could figure
>frequency to wave length?

it's in the study materials, although it's possible to pass the test without
having that exact question either on the test or answering it correctly.

>I don't want to flame anyone but it was a basic fact of radio,, I thought.

it is..

> Dean WB0TKC

but like last night on one of the VHF nets i was on, we had a guy that
was on the air but didn't know what his call was...turned out he'd acquired a
radio from someone else and was told it was a CB radio. we told him what he

really had and what he should do to get legal and then went back to the net.

it sounds like KC7QZR could use an elmer and additional reference materials.

Well, I *was* looking into possibly starting a hobby out of HAM.
But judging by these past 2 posts, one by Bill Newkirk WB9IVR, I see that
the attitudes and childishness isn't lmited to the people on "CB" Radios.
Perhaps HAM isn't for me after all, if Bill is any indication of the
types of people that are out there.
Oh, and by the way, Bill - while you were busy slamming this
other guy for his spelling, I noticed YOU need a few grammar lessons as
well, things that were learned in Elementary School.... such as when you
end a sentence while quoting, the period goes inside the quotes, not
outside. Also you seem to have forgotten to end a sentence or two with a
period. Hmm. Seems you aren't the perfect God-almighty after all.
I was told that if a person needed a question answered or some
kind of help, that other HAM operators were happy to help out, and that
the operators of HAM radios were like a family. But what I've just seen
sounds like Channel 19 at a truck stop. No doubt I'll receive a bunch of
childish ranting and raving, cussing, etc in my mail box, so until
then... Ciao!

Actually a 19" piece of coat hanger just looks "black" and doesn't
attract to much attention, except as an antenna.
Twenty years ago, I was having Mosley 5/8 wave 2 meter antennas
stolen off of my car regularly (they looked a lot like CB antennas, and
this was in the middle of the CB craze). So I made a 1/4 wave antenna
from a coat hanger and put it on the car.
A month or so passed. Then, there was a rash of car break-ins,
and *my* car was broken into. My ICOM IC-22A (2 meter rig) was stolen.
And yes... they stole the coat hanger antenna, also.

BTW... after this (and the insurance paid off) I got a new 2 meter
rig and a Hustler colinear antenna. It was never stolen.

I've used stainless steel welding rods, but even they tend to
deform a bit too readily.

Part-95? No, that's too technical. So is knowing what "RS-232" means. "WWW"? Now there's another story!

When we "grew up" you could find parts stores - with people that were willing to talk to "customers" or "potential customers".

I learned electronics by building... My kids can't, 'cause if Radio Shack doesn't have it, it don't exist.

The good parts houses are all mail order - with a 25 to 50 dollar minimum order.

Kids can BUY elaborate plug-in boards for less than that from Computer stores. They can communicate around the world. Why do they want Ham Radio?

Our Challenge, is to motivate them. Now how do we do that?

...but then this is not the proper forum for that discussion. This forum is for discussing DIGITAL communications...

(So how do we get Youth interested in digital RADIO communications?)

hello everybody, here is BD7IX(Lu Hui-Hua) from P.R.CHINA.
somedays ago, i send a mail at here , said want to know how
to made a modem(tnc) myself, my plan is use TCM3105 or
AM7910(7911) chip to do it, but unfortunate, the chip is
not produce. soi think maybe motorola's MC145442 OR MC145443
can replace it. but mc145442(3) only can use 300 baud
(CCITT V.21 OR BELL 103).
who can tell me the alternative else?
and if i use MC145442(3), who can give the circuit design about it?
please tell me via e-mail bd7ix@amsat.org
thanks

Lu Hui-Hua*bd7ix*

The easiest and quickest way to solve the problem would be to have
the complantant, the person receiving the OO ticket, contact the
ARRL supervisor and report the event. They would then advise the OO
of the misinterpretation and the problem would go away.

The OOs aren't the bad guys here. The ARRL isn't either. You are
not dealing with a person with 20 years of law enforcement training.
An OO is a volunteer trying to help the hobby. He goofed. Big deal.

you didn't read what i wrote. KC7QZR needs to get in touch with the other locals
and probably review the materials he used to study for the test. if he had the
ARRL materials, i believe (relying on memory here) there's even an example
of what he wanted complete with a list of materials, sources of supply and, yes,
even an explaination of why those values are the ones to use (at least at an
entry level explaination...if he wants the engineering version, he can ask for it.)

> Oh, and by the way, Bill - while you were busy slamming this

didn't say i was. and welcome to deconstructionist typography. i do have damon
knight's treatment on grammar from GEnie that is a super reference for only a
few typewritten pages - at least it addresses the common errors and mis-
conceptions most people make.

and this is news - not english class. they'd take points off for not capitalizing
the first word of a sentence. can't say there's a hard and fast rule about trailing
punctuation inside of quotes these days. depends on the usage to some extent.
i suppose you think that there should be two spaces after a period. although that's
something you did with typewriters and not when you have proportional fonts
available.

oh, come now. the guy claims a ham license. therefore, it's expected that he knows something about where the information is located about such things as how to build a simple 1/4-wave whip for 2m. but even if he hadn't known that (as i said, you can pass the test without understanding c=f<lambda>), the fact that the lingo is out of whack indicates that our new KC7 needs further orientation.

remember the object is not to "pump out the most power" but to communicate. and if you actually read up above there, we did tell our bootlegging friend on wednesday that he should consider getting license and he would be welcome, but until then he should just listen and not transmit. in that respect, we were correct in that we advised an illegal station to stop being an illegal station and to get the license and be legal. for that, we run the risk of a citation ourselves (for communicating with an unlicensed station).

i don't think that's a sign of someone not wanting to help. however, things such as some misspellings probably comes from having Dr. Moench at Rose as a mentor ("A -rotor- is the part of a motor that moves. A -rotator- is the device that turns the antenna!").

No, my comment on the punctuation was merely to make a point.
You made several snide (sp?) remarks to him, one of which was making him look ignorant because of his spelling. I was simply trying to point out that while his spelling was being insulted by you, your punctuation was bad. No, it's no big deal, but I was trying to say was it didn't make sense to insult him for his writing/spelling style when yours had its faults too. None of us is perfect.
As for the antenna, perhaps he's just a buff who likes to receive only, not transmit, and doesn't have a liscence yet. The handbook does say that's perfectly legal. Maybe he wants to see what's "out there" before getting into the hobby?
I myself am in that position. However, I'm quickly learning that HAM operators aren't the type of people I had heard they are. This fool Myron Calhoun took it on himself to write me an ignorant insulting letter, implying that newcomers are welcome but if they have any questions that they are NOT welcome to ask them and that any information they get is to be obtained solely on their own.
He ALSO commenced to make a weak attempt at hurling insults at me for asking such a "stupid" question about antenna/wave length. What the old fool didn't take time to do is see who asked the question. That was not me, yet he is going to write me and slam me for it.
Myron challenged my "maturity..." I have yet to figure out where he comes off with that. Even if I HAD asked the question about the antenna and wave length, how does that make someone immature?

Look... I was told HAM operators welcome new comers with open arms and are always happy to help someone else get started in the hobby. I was looking in to it on my own and discovered that there are many ways to go (2M, 6M, 10M, etc) and wasn't sure which way to go. I haven't asked though, because anytime someone asks a question like that, he receives nothing but rude replies and remarks. I haven't asked PUBLICLY that is... I've had the fortune of finding ONE friendly ham though.
I was also told to start going into the amateur (look up the definition for amateur by the way) newsgroups and that I could start participating and asking questions there to help learn. Boy, were they wrong. New HAM operators, or prospects, are treated rudely and insulted... not what I would call a warm welcome.
My apologies to everyone here. I was foolish in believing such an ignorant thing... Don't bother replying publicly, nor in e-mail.
When I post this, I am going to unsubscribe from the asshole, er, amateur radio newsgroups - email will be erased without being read if it's from the newsgroups... don't bother. And don't bother ME.

Hi RWC.

I would like to offer an explaination. It seems the internet can bring out the worst in people. Many come here just to flame and attack. I dont know why it is, perhaps its the anonymity of being behind the keyboard, or something else, but I DO know its basically true in most groups...not just ham radio ones.

There are those who do these types of things reguarly, like Burt, Gerry, Drew and others, as nothing more than to cause trouble. While even I have been sucked into petty flame wars, I think its safe to say that most of us do NOT condon, or support the likes of the above mentioned.

What you heard about hams helping others that want to join is true of most of us. All I will ask, is that you dont base your entire opinion about amatuer radio, by what you hear here.

I would also like to offer any insight, help, suggestion, or anything else you may want, regarding amateur radio.

Take care.

I have a registered copy of this program and wholeheartedly endorse
it. I also have PC-Packrat for Windows, Winpac and HamWindows and
Visual Paketpet is by far the best (for packet--I still use Packrat
for HF digital).

The only thing I don't like is the low-rez low-color startup screen.
Everything else is great.

3538. Digital Modes and the ARRL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-05 00:00:00 UTC
From: Phil Sussman <pactor@pactor.com>
Message-ID: <31DDD89E.2601@pactor.com>
Source record: 36034
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.digital

Greetings,

My name is Phil Sussman, and I am the Editor of PACTOR NEWS, a publication dedicated to HF Digital Modes. (http://www.pactor.com)

Having been involved with RTTY and PACTOR, I am aware, to some degree, of the relationship between the ARRL and the digital Ham Radio operator. The Digital Committee of the ARRL was formed in order to have the ARRL back a policy in line with the needs of the digital community. After a lot of work, the Digital Committee made a policy report and the ARRL pretty much ignored it. Where is that Digital Communittee now?

(Shades of the Environmental Health/Exposure committee)

This 'rift' with the ARRL led to the formation of the American Digital Radio Society, ADRS, a nonprofit organization, which assembled Keyboarders, Contesters, and BBS operators into one unified group. The purpose was to lobby representation of digital users of the HF spectrum because the ARRL was NOT working for the best interests of the HF digital operators at the time. Once the FCC ruled on HF automatic/semi-automatic stations, the unity of the ADRS disolved.

The ADRS split into two groups. The 'original' founders (mostly S&F BBS operators) took the original name and moved on. Those who remained became the International Digital Radio Assn, IDRA, whose members are mostly DX'ers and contesters.

The 'new' ADRS has been silent on its future, and little has been heard from that group since it left the 'old' ADRS. The IDRA kept control of the RTTY Digital Journal, now called merely the Digital Journal. The IDRA; however, has not been concerned of late with those digital issues which were are the heart of the 'old' ADRS.

Meanwhile, the ARRL has shunned policy or representation of digital HF operators, in favor of a 'politically correct' digital policy. In other words, HF digital is still a 'non-issue' at the ARRL. Instead of working to unify ALL digital operators, the ARRL has alienated many HF digital operators, without actually meaning to do so by ignoring them and trying instead to be 'everything to everyone'.

So, I offer three questions to the HF Digital Community:

1. Is the ARRL going to help the HF digital operator by offering any constructive future plans? With the explosive growth of

digital and the meager 'voluntary' band allocations, should HF digital expand into the formerly 'reserved' voice bands? (While it IS legal, is it advisable?)

2. Is the 'old' ADRS or the 'new' IDRA still able to provide the leadership needed to protect the interests of the HF digital operator?

3. The HF digital community needs a unifying body. As an HF digital operator, concerned with the future of HF digital, to whom should we (as a group) look to representation?

Should we support the ARRL with our membership dollars, if they offer only lip service to our needs? Should we support the 'new' IDRA, if they have moved away from lobbying policy?

Your questions, comments, and 'yes' even criticisms are invited.

P. Sussman

3539. Proof Ham Radio Days Are Numbered

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-06 00:00:00 UTC
From: john mcmurray <murray@bright.net>
Message-ID: <31DF2264.5FB8@bright.net>
Source record: 35950

Hi ALL;
The main proof I can see is the advent of such programs as Fretel and Net Talk and others like that.

All a person has to do is buy a computer and software and Bingo they are on the air, no test, no code nothing and I feel if the Ham Radio world don't step up and come forward with less stringent requirements such as dropping the code and coming into the twenty first century it may be all over. The US government drop code a while ago because it wasn't use ful any more.

thanks for the time

John Kc8aar

3540. Electronic Engine Control Noise: Mobile Operation

I am W6KLK. I am using my Yaesu FT-890 in my 1992 Toyota PU V-6 for mobile operation. The noise from the electronic engine control (located on the passenger side panel) is severe and making reception impossible. I am an electrical engineer and I have done mobile noise supression in the past (1950ties) but I am stumped on this one. It appears to be radiated interference, not conducted, but I may be mistaken.

I would appreciate suggestions on how to solve the problem.

Please respond by email. Thanks!

Keith W6KLK <knelson@aimnet.com>

3541. loss of 2 meter 70cm bands

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-06 00:00:00 UTC
From: Joesph Fenn <jfenn@spartacus.hula.net>
Message-ID: <Pine.OSF.3.93.960706143937.28482A-100000@spartacus.hula.net>
Source record: 35952

I dont know if everybody aware of our possible loss of the 2 meter and
70 cm bands in the near suture. These are of course 2 of our most used
digital bands with all the packet clusters, etc. The FCC has offered
to give them to commercial interests and will propose same at the
"WRLC" conference coming up this year. If you havent written the FCC
to complain about this yet, please do so now, or better yet go over
their heads direct to your favorite Senator or policitian or
member of the house (how about Gingrich he can really start up a
hornet nest on this kind of stuff). The ARRL I believe went public
on this in QST (July) after receiving no cooperation from FCC on
expunging this proposal.

I saw some 'ham' type programs for this board at the 1985 AMSAT national convention. Tom, W3IWI had something for it. I think a spectrum analyzer as well as something that allowed him to operate EME CW with a OSCAR class station. I forget the other fellows call (a N4???) but he was real sharp also. Maybe someone else on here remembers.

>point me in the right direction?

The "standard" solution for using Baycom modem with FBB is to use
BPQ and a driver called BPQAX25. This works very well if you have
reasonable computer power.
You can also use a german driver called TFPCX - works like hostmode
but has no node like BPQ.
I have tried both with success.
The sofware should be available from many sources on the net.

Hi friends ;

I wonder if any one could help me know a guy called (John C. Bottom),
he is an American , he was working in Saudi Arabia with HUGHES AIRCRAFT
CO. for peace sun project until last six years when he quit and left for
good, I sent him a couple of letters three years ago on the addresses
below but no respond yet.
Appreciate any attempt might help know anything about him.

>
> ...phil

Exactly, Phil...

The specific issue in question is if a 2m backbone is in violation of
THE RULES. It clearly is not.

The problem is that OO's come in three basic "flavors"...
(1) The good ones that know what they are doing and actually act
upon Part 97.
(2) The ones that blindly follow the ARRL's opinion (note I did not
say 'interpretation') of what Part 97 _should_ be.
(3) The vindictive ones that hate anything they can't understand.

Sadly, Flavor #1 appears to be the smallest group.

On a more global scope, the entire idea of the Amateur Auxilary and
Official Observers is, pardon my directness, crap. How would you react
if, for example, the IRS just turned loose a bunch of people off the
street that would be able to decide if you should be audited? Same
thing.

I have yet to find a lawyer, either general practice or communications
law, who believes that the OO program would survive a court challenge
to its existence.

I have received somewhere around (I don't keep score) half a dozen or
so OO notices over the past few years, all but one from a single
individual OO in CA (I am in MO).

The one from another OO was because my packet BBS forwarded a message
with "hell" in the signature (the message originated in NC). Note that
the originator of the message and the SysOp of the originating BBS did
NOT receive notices. Go figure.

The other OO who has sent me at least 5 notices has a problem with
packet bulletins about recipes and hobbies. To avoid further
embarassment to him and the ARRL, I won't give out his call sign (he

knows who he is and he reads this group), but after filing official complaints with the ARRL, FCC, my Senators, and Representative through my lawyer, this OO and the ARRL decided that discretion is indeed the better part of valor.

With the current House Resolution that would remove all responsibility from the OO program, we are in for real problems. (I have misplaced my note with the number of the HR...) I would encourage ALL Hams to drop a note to their Representatives asking them to stand OPPOSED to this House Resolution and to mandate that the FCC do their job, not delegate it to non-public agencies or individuals.

Take Care & 73

Phil,

I think you talk about things that is pretty close the heart. About three years ago, a number of HF digital enthusiasts had a very productive session at the ARRL DDC. The need for a group devoted to the technical development of HF digital issues was identified and TAPR took us under it's wings and HFSIG was formed.

The objective was to promote technical developments and a platform for the exchange of ideas related to HF digital developments. This is contrary to the trend that been going the past few years of "closed" prorietary protocols that have been appearing.

HFSIG has been going strong and have beeb a presence at every DDC ever since. A meeting with strong thechnical content is being planned for the upcoming DDC in Seattle, September 20-22. The program will include presentations and demonstrations of an amateur version of the Watterson HF digital channel simulator, an over view of a number of very innovation HF digital modems, including the latest four-channel TOR mode called QUATOR. You will probably also hear what folks like Phil Karn have been doing using the power of a Pentium and low cost sound card. This meeting is a MUST for all those interested in HF digital.

HFSIG also conducts very lively discussions of all topics related to the development of HF digital including, DSP techniques, modulation waveforms, error-control coding, and protocols. The nature of discussions are very technical and contains a lot of meat and inspiration for those doing some real work. Please note: we don't ask anyone, especially manufacturers for accesss to priviledged code or technology, however, we encourage an open and free exchange of ideas and provide a home for examples of good software.

I just wish to point out that there still are very innovative work being done in this field - there is a choice besides buying a black box to do HF digital.

Keep up the discussion. Good luck with your newsletter too.

73,

Johan Forrer, KC7WW
(HFSIG moderator)

Good point, Steve! We should all remember that.

Any volunteer deserves SOME slack. That includes packet sysops, even
the misguided ones who allegedly censor beyond the spirit of Part 97
and do other "terrible" things trying to help. It all comes in
the package called "AMATEUR radio."

Greetings All

Has anyone managed to get the DSP-232 working with TPK 1.82? Or for that matter, winpac? I have the PcPakratt for DOS and for Windows and obviously both work with this TNC. However, I like the convience and ease of use of TPK and Winpac (used on a MFJ1270B) and would like to use them with the new tnc. Any information will be greatly appreciated.

Many thanks

: time was wasted. I want HF voice priveledges. CW is irrelavent and outdated.

Here's why CW is relevant. As a 21 year old, I don't exactly have $3000
to spend on an HF rig. So I'm learning CW so I can get myself a Ramsey
QRP receiver and transmitter, and get on HF for about $100 US.

Besides, those nifty QRP rigs are nice and portable, which opens up lots
of possibilities. The receiver is powered by a 9V battery, and all I
need is to figure out how to power the transmitter by solar panel, and
the possibilities really open up. ;-)

As an aside, manufacturers need to start producing low-cost all-mode VHF
rigs, particularly 6 metres and 2 metres, so that no-code hams like
myself can get a taste of DX, which will encourage us to learn code and
buy those $3000 HF rigs...

Good for you! I am a 16 year old and the QRP bug bit me. I am a
General (Soon to upgrade), however there are a lot of kits out there
for QRP. It sure proves that an amp is not necessary! It also gives
people a chance to build their own equipment. Most Hams today would
rather fill out a check or give out their credit card #, unpack the
box, plug the rig in and call "CQ". They don't want to put any effort
into their equipment, which is a HUGE rush when you have a QSO with
something you were soldering together the night before.

Good for you, again. It is nice to see you are putting a ton of
effort into the hobby itself. Don't stop when you upgrade! Climb to
the top of the ladder! I wish you luck.

Steve,
You are confusing LITTLE LEOS with BIG LEOS. They are too entirely different animals. Teledesic HAS frequency allocations (huge ones!) at 19 GHz and 29 GHz. For your amusement I have provided a large number of references below that you can read and check yourself. And there are many more reference than just those cited below.

Here is more information posted originally under a different heading:

"It is almost funny - one of the most accurate and reliable
sources of Amateur Radio information <satirical comment about
you know who!> - posts a note with comments about Kenwood
sales practices and Microsoft and the computer
industry allegedly trying to grab Amateur Radio bands -
and most everyone takes his word for it!

Even funnier is that information refuting most of these
claims is easily available right here on the Internet.
To refute allegations that Teledesic is
one of the LEO's trying to "take over" the Amateur bands,
I spent all of about 5 minutes using DEC's AltaVista search
engine. Here is some of what I found.

1. The Teledesic Press Release
You can read the original press release form Teledesic announcing their plans for a "Big LEO" high speed data network based on 840 orbitting satellites. According to the story, cellular phone pioneer Craig McCaw, and Microsoft founder Bill Gates, made founding investments in Teledesic. In both cases, these investments were made by the individuals and are not connected to either McCaw's cellular/SMR properties nor Bill Gates' Microsoft Corporation. McCaw and Gates made personal investments as founding investors in Teledesic.

You can read the press release:
http://www.att.com/press/0394/940321.pca.html

2. Teledesic is using frequencies at 19 GHz and 29 GHz.
Teledesic is a "Big LEO" operation, not a "Little LEO" - the "Little LEO" companies are the ones who wish to consider use of the Amateur allocations for their 2-way messaging systems.. You can read about the frequencies that were allocated to Teledesic at:
http://techweb.cmp.com/techweb/cwi/current/155news1.html

3. FCC Documents
You can read at least one of the related FCC documents concerning Big LEOs online at: http://www.fcc.gov/Bureaus/Wireless/Notices/fcc95287.txt

4. Bill Frezza's article comparing Big and Little LEOs
Bill Frezza is formerly a marketing manager at Ericsson; former
President of the Personal Computer and Communications Association;
and current wireless industry consultant and pundit, writing columns
for several publications. You can read his column on Teledesic at:
http://techweb.cmp.com/techweb/nc/615/615frezza.html

And now, shame on those of you who bought you-know-who's silliness
hook, line and sinker and didn't bother to even make a modest effort
to check his wild allegations. "

>73, Jim KH2D
>

It depends on what system you are using, if it is AX25 (normal)
packet, then yes, every thing you send can be read by another station
monitoring. There is also a system very simular to the internet,
TCP/IP where you are assigned a IP address, and you connect to people
via a gateway, the same as dialing up your server on the internet. You
have your own personal mailbox which will request and send mail
automaticly, retreave news articles at given times. If you decide to
connect to the server, you then give your callsign and then password
to gain access to the bbs/gateway.
depending on what version software you use, (I used JNOS 1.10H - for
UK use) depends if the mail and news articles you are sending and
receiving are compressed (in effect encoded) which makes it imposible
for any station monitoring to read. all they know is that you have
connected to the gateway..

A bit long but I hope you find this information useful..

some more information on jnos or wnos may be obtained from
paul@g0mhd.demon.co.uk (if your reading this, hope you dont mind..)

Hi. Yes it is posible.. all you nead is a program called TFPCX. if you
are using the latest FBB programs, this program is included in the
installation files.. I am not sure if you can run more than one port
or not. maybe some one else will be able to tell you. (i use to use
fbb as a mailbox) If you want to use fbb purly as a file server, maybe
nos will be of help to you, with nos, you can ftp files instead of
YAPP or 7Plus.. if you want to know more info on NOS, please email me

3567. HamComm program - any good?

Newsgroup: rec.radio.amateur.digital.misc

Does anyone have any experience with the HamComm program which lets you use your computer to receive RTTY without a separate TNC? I downloaded it yesterday and it looks interesting. All it requires is building a simple level converter out of a op-amp and a few parts. It looks too good to be true and you know what they say about those kind of things...

I agree with the first part of your statement but not the second. For people who just want to use the keyboard to talk to someone, the 'net is the perfect place for them. On the other hand, amateur radio is first and foremost for people interested in RADIO - the art, the science and the skill of it. If all someone wants to do is yak, let 'em do it elsewhere.

No challenge either. Their not on the AIR. Their on the wires or cable.
Get on the computer and "talk" to a guy in France? BIG CHALLENGE. You can HAVE
it.

>Yeah, right. Why can't you just assume that perhaps this is the action of
>a misguided OO? You think that the ARRL sits in Newington thinking about
>ways to make life miserable for people? That's cute!

First off, let me say that I am talking ONLY about packet... It is my
exclusive operating mode.

The problem is, Robert, that _all_ OO notices that I have received
(about 6 over the years) and most I have seen have been MALICIOUS in
nature.

The bottom line is that if a packet station/operator does something
that a particular OO does not like or something that the powers that
be in the ARRL does not like, regardless of the rules, you will
receive an OO notice.

>One thing that amazes me about this thread is that I do not recall seeing
>exactly what the OO notice said. Are we all SURE that the warning was for
>using a "backbone" on 2M. Is that what it said? Where was this backbone?
>146.52MHz? 144.200MHz? We don't have all of the facts (or at least I have
>not seen them) so how can we jump to conclusions.

No one is jumping to conclusions. Read the messages here again... They
are fairly general. Not one has advocated any violation of the RULES,
simply to make sure that the OO/AA/ARRL is _really_ going by the rules
and not by their whims.

>Not true. You also have to meet the limits for message content. Plus the
>FCC has generally considered it not right to go against standard Amateur
>practice (ie. no packet on 146.52 please!).

See above.

>Yeah, that will make things better. If this OO sent out a notice
>based only on the fact that backbone traffic was being sent on a
>2M frequency, then that OO needs to be informed about the rules.
>Try sending him/her a letter and send one to the ARRL as well.
>This is all assuming that other factors (frequency, message content,
>etc. do not play any part in this).

This has done little good in the past... Right up to the point where
papers where are served, the ARRL wants to stay in the background and
simply encourage THEIR version of Part 97.

>Yeah, sue every Amateur volunteer for everything their worth. That
>will make Amateur Radio better.

What would you suggest to keep the OO/ARRL honest? Perhaps if we
ignore them, they will go away?

>BTW, the club I belong to got an OO notice several years ago for
>operating too close to a band edge. Turns out they were very
>much right. We found out who had been operating at that time
>based on the log and made them more aware about the bandwidth of
>a SSB signal. We appreciated the reminder.

Again, a _GOOD_ OO can do a good job and provide a service to other
Hams. Problem is, most have no concept of the real rules and so go by
what the ARRL (mostly in the form of the SM and/or DD) tells them that
the rules mean.

Sorry folks, but I can read.

Also, why do we even need the OO to do things like your example? In my
opinion, the proverbial "Good Amateur Practice" includes helping out
other Hams to know when they are outside of the rules or even on the
fringe.

>I think we ALL could stand to reread the rules now and then.

I agree 110%! Sadly, most Hams I know don't even have a copy of the
rules in any form! Most that do, have the ARRL Rule Book that is,
IMHO, about as bad as nothing at all. Let's face it, most of Part 97
is simple common sense. There are some details, but most is, as
Grandpa said, Horse Sense.

Afterall, it takes few brains to figure out that:
(1) Ham Radio is open to a large group of people.
(2) There may be kids on the air.
(3) There may be sensitive folks on the air.
(4) Don't cuss like a sailor!

IMO that proof is not even close. There are plenty of apps
that allow half and full-duplex verbal communications but that doesn't
mean anything. These apps are great for scheduled "QSOs" with other
parties but beyond that they are of little use.
Try 20 "QSOs" at random, either passively or actively. (No
cheating, if you call don't look for callsigns.) Whether you call or
are called it doesn't matter, most of the "QSOs" will have little if
any real content. Other than hardware and software, you will have next
to nothing in common to initiate a conversation. Many of the "QSO's"
will be with true appliance operators who are almost totally clueless
about how their equipment works. These contacts might be the good ones
as there are of "lids" on the 'net using these apps. I seriously doubt
that you will even come close to getting RCC from a random "QSO".
Additionally these apps do not allow the user to "copy the
mail" of an interesting "QSO". IRC is at least somewhat better.
Ham radio's days might be numbered but not because the "phone"
software.

Wasn't 137-138 MHZ already allocated for satellite use ? This is where
the weathersats beam down pictures. The rest of the world isn't likely
to clear out their entire investments in this band just to make it
possible for one company to use in the US, are they ?

I have a DJ-180 for packet. I used the same cable as used with my
Yeasu FT-530. I purchased the MFJ ready made cable fromHRO. Cost
about $15. It is cleaner and easier than making your own for the
price. It also has a ext speaker jack to monitor if you like.

Wonder if any of you have conducted experiments, or
have come across papers on the interaction of EM waves
at and near 1.2, 2.4, or 5.7 GHz, with materials?

I am particularly interested in the following materials:
plywood, wafer board and particle board of various
thicknesses, and; asphalt shingles. I am interested
in these materials with varying moisture content,
and if anyone has studied particular adhesives used
in these products.

I am interested in the effects of these materials when
located within the radiating near field of an array.

Any pointers would be appreciated.

Mike

Why not expand digital modes down into the CW portion? There seems to be more free spectrum available there. All digital ops (including CW) need to use 500 hz receive filters AND make sure they are not overdriving the rig on AFSK and that they have no hum on the signal due to ground loops, etc.

While the ARRL is failing to support the digital modes, they do make a difference in other areas. For this reason I would not advocate withdrawing financial support, BUT I think we digital ops need to make more noise at the league with letters and E-Mail. We also need to get some good digital related articles into QST. I enjoy Pactor News and the Digital Journal but these reach primarily the serious digital ops wereas QST articles reach the "average" ham who probably has little information beyond voice and CW (when is the last time you read a Pactor-II article in QST?).

Anybody out there still using the old Commodore 128 and the "Digicom"
packet software??? It was popular all over the world at one time,
used the 7910 world chip in a card that plugged into the cassette
port. I still use it here for 2 meters and Army Mars nets. Have
2 questions.

1. How does one send a single msg text but address it to 2 or
more ham calls? (or is this a function of the software only)
2. I know it can be done on other packet software such as the PC
version put out by AA4RE, but can it be done with my stuff?
3. I can of course send the one text msg to one stn on one system,
and to a 2nd stn on another linked system by following
s xxxxxx,routing (to get it to xxxxxx at a different pbbs.

I have a curious problem I am trying to figure out and I hope that my musings on this might suggest to someone the reason and/or a cure.

I'm an active member and the VP-elect of the University of Texas ARC, W5EHM. Our club has a station on campus, which includes a simple packet station. We have an old IBM XT with a version of Procomm for DOS, an old Kantronics KAM (firmware version 2.0), and an old Yaesu FT-227R "Memorizer" 2m FM radio connected to a large ground plane vertical atop our tower at ~120' above ground. Most of the time, this setup works well enough. Some of the time, though, we experience what can best be described as spurious characters showing up in the terminal program. These characters are totally random and appear only in the terminal program, they do not appear to the KAM at all. Typically, there will be a few lines of spurious characters that show up on the screen, I will have to hit enter to proceed, but this will drop me out of convers mode and back into command mode - I type 'convers' at the cmd: prompt and I'm back in business (so to speak.)

As I mentioned, this does not happen all the time - but it is most likely to happen when the rig is keying up. Usually, the spurious characters showing up on the screen will coincide in time _exactly_ with the length of the transmission. I am also informed by the HF operators of the club who use the DX Cluster in town that having the HF rig on also seems to contribute to spurious character generation. I doubt it's the cables - everything is really well shielded and we've even put RF chokes on most of them. This occurs with either 'mon on' or 'mon off'. I've been able to compose pmail and hold realtime QSOs with operators across the state on TexNet without these characters being at all noticeable to anyone but me. But it's REALLY annoying.

The one thought I have on this concerns the LED bar graph on the KAM. This bargraph of eight LEDs is only really useful when using the HF port on the KAM is in use. If you're only using the VHF port, the normal behavior is that LED #5 is lit constantly and all other LEDs are unlit. But when the spurious characters are generated, I occasionally notice that LED #4 is blinking very rapidly. We currently do not have a cable connected to the HF port. Could it be possible that maybe the unconnected HF port is somehow picking up a harmonic of the nearby 2m rig and trying to decode ASCII or AMTOR or something and unceremoniously presenting it to me on the terminal screen? I think this is a stretch, personally, but it's the only thing I can come up with at the moment. If this were the problem, though, could I make some sort of dummy connector with lots of resistors for the HF port that wouldn't pick up the harmonic?

Or is it possibly the old computer at fault? How would I investigate that?

If anyone has any thoughts on what the problem might be or any suggestions that might enable me to confirm what is causing this, the UTARC and I would both be grateful. We might even send you a QSL card in appreciation :-)

3584. NEW JULY HAM POLL QUESTION NOW ON-LINE>>http://www.sarrio.com

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-08 00:00:00 UTC
From: wb6siv@cyberg8t.com
Message-ID: <wb6siv-0707962226120001@host01.cyberg8t.com>
Source record: 35977

These are the most recent Ham Poll results as of July 7, 1996

The question for July 1996:

The ARRL has started a massive letter writing campaign. This campaign is directed at a proposaloffered by the "little LEO's", the low-earth orbiting satellite industry. Their proposal would have the FCC support a position at the International Radiocommunication Conference (WRC-97), that would allow the 2 meter and 70 cm bands to at be shared jointly by both the amateur radio community and the cellular phone industry.

The question I am asking this month is: "Do you support the ARRL view that this proposal is a serious threat to Amateur Radio, and needs to be aggressively opposed?"

If you believe this proposal is a significant threat to the future of ham radio, and should be dealt with
aggressively, check (depending on your level of support) either "Strongly Agree or Agree". If, on-the-other-hand, you do not believe this proposal has the slightest chance of being approved and you therefore see the ARRL's response as extreme, check (depending on your level of disapproval) either "Strongly Disagree or Disagree". If you have not formulated an opinion on this issue yet checkthe "Not Sure" box.

The results:

Strongly Agree |********** 21
Agree |*** 3
Not Sure |* 1
Disagree |* 1
Strongly Disagree |***** 5

Total votes displayed: 31
check the "Not Sure" box.

Various materials have been tested by putting them
in a microwave oven, e.g. PVC. You can be sure that the
material you mention are very lossy when wet.

>I am interested in the effects of these materials when
>located within the radiating near field of an array.

Why? you should not have any materials in the near field,
i.e. a few wavelength around your antenna. This is however
not too difficult at SHF.

> -Jeff WB8WKA

I see my name being taken in vain! First, my cohort was Bob McGwier,
N4HY.
The Delanco-Spry board, by current standards, is a real antique. It used
a TMS32010 (or optionally at 32015).

The board served as a starting point for a number of other DSP
adventures
for several of us. Some of the learning from it are in Bob's DSP2232
modems,
some are in the TAPR/AMSAT DSP93, and some are in Phil Karn's (KA9Q)
Viterbi
decoders.

I probably still have some archive disks around here if they are really
needed. Some of the code we (Bob, Phil, Franklin Antonio, Dick Allen
and others) did included
- real-time spectrum FFT analyzers
- 400 & 1200 baud PSK modems
- Bell 103 & 202 AFSK modems
- Digital Sampling Oscilloscope
- Hadamard Transformer for reversing USB/LSB
- ADPCM decoder
- N4HY, I2KBD and I used FFT DSP techniques to get 70cm EME echoes

with Oscar
class stations.

There are some unused boards around somewhere. I probably have a couple in the
"miscellaneous dead boards for antique PC's" junk box. One caution: The board
takes a LONG PC slot, and it CANNOT be put into a a full 16-bit ISA (i.e. PC-AT)
socket -- you MUST have an 8-bit slot.

3588. NET_Mac2.3.60.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-08 00:00:00 UTC
From: adam@iag.tno.NL
Message-ID: <199607080910.LAA11498@iag.tno.nl>
Source record: 35981

The Netherlands, July 8, 1996.
Hello dear reader,

NET/Mac v2.3.60 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Recording a finger-session now results in a TEXT-file
- Support for 'rtzone' comand
- Fixed a bug that could crash NET/Mac after a 'ping clear'
- You cannot return to the window of a closed session anymore
- Trace to a file now result in a TEXT-file
- The hosts-file is no longer busy after using the 'hostfile' command
- Implemented some mods to trace an infinite loop in 'route expanded'
- Implemented just a minor mod for the Mac512Ke version of NET/Mac

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory public/mac.

> Dean WB0TKC

It is one of the questions in the pool, but it isn't necessarily on
every test. However, it is naive to use that formula for a real antenna.
You almost always have to adjust the length in order to account for other
variables. The formula gives a *free space* value, but our antennas are
rarely mounted in free space. There are also mechanical factors to consider.

It is not unreasonable for a new amateur to ask this sort of question.
Often those things which appear simplest to those of us with practical
experience can be the most baffling to those with none. Remember, the
only stupid question is the one you neglected to ask.

>Some of the time, though, we experience what can best be
>described as spurious characters showing up in the terminal program.
>These characters are totally random and appear only in the terminal
>program, they do not appear to the KAM at all.

This sounds suspiciously like the classic symptom of a problem that eventually afflicts many (most?) older Kams. The problem is low, or poorly regulated, DC supply voltage. The cause can usually be traced to one of two sources - one external to the Kam, and one internal. Check out the external causes first, of course. Both

Since your symptoms seem to be triggered by keying the xmtr, I would first look to the stability of your DC supply. If it is a shared supply, it could be that the xmtr is pulling too much current for the regulation of that supply to handle. As the DC voltage drops below some critical point, the serial communications driver in the Kam becomes unstable and begins generating garbage characters, output to the computer.

The internal source of the problem is usually traced to aging electrolytic caps in the Kam. There are two little cans, located side by side and very near the voltage regulator that is heatsinked to the Kam's case. Replacing these seems to be an eventual requirement for most older Kams. Fortunately, they're easier to replace and suitable replacements are easy to come by.

If you like version 1.5, try 1.6. Even better, except that the docs
are worse. Keep your 1.5 book handy.
Also, I've run my 2 meter in open squelch mode for years,
and never had a problem. Audio chips don't mind 100% duty,
they do it all the time in your car radio.

3599. Modes Used for EME

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-08 00:00:00 UTC
From: Chris Broadbent <cfb@bga.com>
Message-ID: <31E1529D.6E24@bga.com>
Source record: 35992

(I tried to send this to both the .misc and the .digital.misc group, but I goofed on the digital group - apologies for sending separate posts).

Doubtless this will stir up the usual hornets' nest, but that is not the purpose of the question. I am genuinely curious.

From what I have read, EME is perhaps the most challenging DX activity WRT phase distortions, SNR, fading, etc. The Moon's continually changing radial velocity, its convex surface, low reflectivity and great distance present all sorts of interesting challenges.

I read that EME operators use just about every trick in the book in order to make successful contacts. They are very much on top with DSP's, real time Fourier analyses, highly directional antennae, ultra sensitive receivers, high power transmitters, etc.

Yet, with the much vaunted advantages of the various modern digital modes, CW is the EME operators' choice of mode. Why is this?

Again, this is a real question. It is not meant as flame bait and I hope it won't trigger another round of the CW vs Digital argument.

Cheers,

Chris (cfb@bga.com)

I'm wondering if I can use my Tandy model 102 laptop to do packet.

The laptop has basic built in, and it has a parallel and serial port. I would think that if I could find some software (or write my own) it would work (naive of me?)

best,

Erik

I agree with John, WinPack is a great packet program and its also
freeware. The latest version can be found at the following:
ftp://ftp.demon.co.uk/pub/ham/winpack/winp553.zip 1329391 bytes

In my view, there is no such body at this time.

> Should we support the ARRL with our membership dollars, if
> they offer only lip service to our needs? Should we support
> the 'new' IDRA, if they have moved away from lobbying policy?
>
> Your questions, comments, and 'yes' even criticisms are invited.

The ARRL has generally failed dismally to provide any leadership
in any of these areas (e.g. standards, best operating practices,
inter-regional networking issues, etc. etc. etc.).

Had some hope that IDRA would provide such leadership, but it appears
to not be happening.

Such simple issues as "What designator should we use to mean that
a bulletin should be sent to all BBS systems in North America" cannot
even be resolved. There is no mechanism to resolve these issues.

The good news is that we have generally good local and regional
networks. The bad news is that the long haul networks have been
preempted by the use of the internet and other commercial traffic
handling means ... and are now pretty much dead.

So maybe the answer to your questions is "Hams are not interested
in creating a world-wide Ham Radio network, so the answer to your
questions is unimportant. Hams have chosen to use the telephone
instead of Ham Radio to do these things."

Gary,

I tried mine after I sent the last message. When I hit CTRL-G,
it comes up with a black box in the middle of the screen. (This may be
a bug in the program, I believe the older version prompted for a
filename) You can enter the filename in this box without the .gif
extension then hit ENTER. A box will appear over the image, you can
then use the arrow keys, page up/down, and +/- to position the box
over the area that you want to save. When you hit ENTER, the .gif
will be saved in the AEAFAX3\PCX directory.

Hope this helps,

Hugh

HELLO FELLOW HAMS:and FUTURE HAMS !!!!!!!

HAM BBS dedicated to amateur radio !!!!

There is a DEVOTED AMATEUR RADIO BBS in town ,from your
ARRL/LAX affiliated club coordinator , JOE CIRA , KB6AXK .....
Everything and anything about AMATEUR RADIO will be found here,
IF NOT ? Let me know and we will post it and file it !!!!!!!!

HAM*INFO*LINK*SOURCE BBS at 1-818-584-1952....
24 hrs,8-n-1,anyspeed.......
running 486/66 with 2.1 gig of space !!!
qsl route database,clubs,newsletters,bulletins,shareware,utility
mods,programs,test ques,lists,software and much more....
VEC/VE exam & class list for all So.Cal.
sample exam tests and answers for all class's..
ARRL mirror of all there files !
Using Wildcat v4.11 software..
easy to log in and no FEE's it's FREE !
6,000 FILES IN 119 FILE AREA'S..so far !

latest list of AMATEUR RADIO WEB SITES & PAGES
now 2,405 websites & pages !!!!!!!!!
and GROWING FAST ?!?!!

P.S. also available on the web at:

http://www.padl.ac.at/schule/chemie/bob.htm
look for web-sites by KB6AXK on the page........

FYI:there are roughly ,over 33,000 pages,just pages,
that relate to amateur radio/ham radio on the web ???????
My list is primarlly websites.............

>146.52MHz? 144.200MHz? We don't have all of the facts (or at least I have
>not seen them) so how can we jump to conclusions.

I wrote a message to pcr@ic.net (Phil Reed) who
orginally started this thread asking him who the parties were.
He didn't know the OO but gave me the name of the cited party.
I happened to know him and contacted him. Turned out I knew
the OO as well. He (the cited) tells me he was told to remove
his 9600 baud tcp/ip converse link from 145.77mhz as it
was in violation of a 'bandplan' authored by MIPAC, which
claims to be a frequency coordination body in Michigan. While
he tells me he was unable to find any specific usage reference
in the cited bandplan, he moved to another frequency. Apparently
this solved the problem.

I also called the OO but he didn't return my calls.

I don't have much of a problem with the above transaction, and
in fact, since this is all third hand, I wouldn't give it much
thought. I'm a advocate of removing dedicated services from
user accessable frequencies. (like links)

What *did* raise my eyebrows (and tell me what you think about this).
It seems the OO who cited the amateur for violation of the bandplan
is ALSO the President of the same group that AUTHORED the bandplan!
This easily can be confirmed and apparently has existed for a while.
With over 26 OO's in Michigan (and 9 in the area in question) it
seems to me there shouldn't be any need for this OO to have to
enforce his own bandplan. While, from what I've heard, this
in minor compared to some other OO transgressions, this percieved
conflict of interest bothers me.

marty@trucom.com (Marty Albert) wrote:

>The specific issue in question is if a 2m backbone is in violation of

>street that would be able to decide if you should be audited? Same
>thing.

Most of the ones I have known fall under "Flavor #1". But even one
bad OO is one to many in my opinion. We have to hold our law enforcement
personal, be they volunteer or not, to high standards.

>The other OO who has sent me at least 5 notices has a problem with
>packet bulletins about recipes and hobbies. To avoid further
>embarassment to him and the ARRL, I won't give out his call sign (he

>marty@trucom.com

Its H.R. 3207. You can find your representatives e-mail address at
http://www.house.gov

Steve Wolf <no8m@apk.net> wrote:
>
> The OOs aren't the bad guys here. The ARRL isn't either. You are
> not dealing with a person with 20 years of law enforcement training.

Steve, let me ask you this since you are a Assistant Sectional
Manager for the ARRL in Ohio. What kind of screening does the ARRL do
before one becomes a OO? Are there background checks
on the OO? Educational requirements? Drug testing? Do you offer any
kind of training to the OO? All of the above are required for FCC
agents in similar roles.

> An OO is a volunteer trying to help the hobby. He goofed. Big deal.

Understood. But with the recoprical agreement the FCC has with the ARRL for rule enforcement and now the pending House Resolution 3207, the OO's are going to be holding awefully big sticks. I, like many others, are concerned. More accountability is needed with the current program.

I've been looking for a good Windows packet radio program, too. Of all the programs I tried, none had anything in it's documentation about what firmware in the TNC is required.

One of them probably wanted TAPR, which I concluded from how TNC parameters were given and the fact that it didn't work with my TNC-2c from a kit, which has TheFirmware 2.7b from NORD><LINK (WA8DED compatible). The documents just didn't say anything explicitely about this.

An other program I tried seems to put the TNC in KISS mode and the lights on the TNC start behaving in a very strange manner. Nothing was said about that either, so I can't know if things are as they are supposed to be. Actually this new mode of operation caused a whole lot more digital hash, too, and the squelch on my FT-290RII suddenly started behaving erratically.

So, I'm still looking, but from what I've seen I like Graphic Packet (GP) best. It's not Windows, but it worked right away.

Chris Broadbent wrote:
>
> Yet, with the much vaunted advantages of the various modern digital modes,
> CW is the EME operators' choice of mode. Why is this?

CW is stone simple, it is easy and it works. EME signals suffer from poor coherence. The reflected signal from the moon is not well suited for most coherent communications. What might work is a signal using a wide FSK which shifts state VERRRRY SLOWWWLY. Basically the idea is to use a very sharp filters for mark and space and integrate each of them. Compare the mark and space integrations and you might get a useful signal. You'll have to compensate for lots of things, though, perhaps even minor doppler effects.

In addition to the coherence problem on the reflection, you have a significant time delay (a little over two seconds) from station to station. This makes it much more difficult to run modes such as AMTOR except as a broadcast with lots of FEC.

Wide band communications via the moon was tried by the military in the 50's and 60's, back when satellites were rare to non-existant. They weren't able to get much more than a simple RTTY signal from the lunar echos, mostly for the reasons I just cited.

Gary,

You can convert the .VGA images to .GIFs from within the FAX III
program. I believe you have to have the image on screen that you want to
save, then press "CTRL-G".

The above is sad but true. We have a fairly active world-wide network on Navy MARS but even that sometimes seems to be dwindling in favor of other methods. We have been getting out and "selling" ourselves and the tide is slowly turning back our way.

The 102 has a built in terminal program. Just hook a TNC to your serial
port and use the terminal program.

>of the misinterpretation and the problem would go away.

Been there, done that... In my own personal experience, the ARRL SM,
DD, and main office were very defensive of the OO and his mis-informed
positions. It had no effect until the lawyers, FCC, and
Congress-Critters were involved.

>The OOs aren't the bad guys here.

You are right, the individual OOs are not the bad guys, no matter how
poor they are at their duties.

>The ARRL isn't either.

You are wrong... The ARRL has the responsibility to make sure that the
individual OOs (and their supervisory staff) are well trained,
objective, and understand the rules. Instead, we see that the ARRL
uses the OOs to promote their own agenda.

>You are not dealing with a person with 20 years of law enforcement training.

No one has said that we are... All that is asked is that OOs be well
trained and objective and that the ARRL and management do the same.

>An OO is a volunteer trying to help the hobby.

By and large, this is true. There are way too many OOs and supervisory
staff that are being vindictive and subjective. Also, there is a
significant percent that have serious conflict of interest problems on
the bands.

>He goofed. Big deal.

Are you 100% certain of this? The facts I have found show that, in
this case, the OO was inforcing a non-published bandplan that HE had
authored.

Sort of blows the concept of separation of police and judicial
functions right out of the water.

Frankly, I see little chance for this situation to self correct any
time in the near future. The passage of House Resolution 3207 will
remove all possibility for a Ham who has been wrongly, or even

maliciously, cited by an OO to have the error corrected.

The best answer, IMHO, would be for Congress to _REQUIRE_ the FCC to
do the following:
(1) Disolve the Amateur Auxilary
(2) Do the job they are PAID to do... Enforce the rules

I've interfaced the 9612 to a KS-960, which is the 2W version of
the 1000, and it was just plug-and-play. I just had to adjust the
xmit deviation on the 9612.

From: adam@iag.tno.nl (Adam van Gaalen PA2AGA)
To: adam@iag.tno.nl
Subject: NET_Mac2.3.60.sea.hqx.text

The Netherlands, July 8, 1996.
Hello dear reader,

NET/Mac v2.3.60 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Recording a finger-session now results in a TEXT-file
- Support for 'rtzone' comand
- Fixed a bug that could crash NET/Mac after a 'ping clear'
- You cannot return to the window of a closed session anymore
- Trace to a file now result in a TEXT-file
- The hosts-file is no longer busy after using the 'hostfile' command
- Implemented some mods to trace an infinite loop in 'route expanded'
- Implemented just a minor mod for the Mac512Ke version of NET/Mac

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA e-mail: a.vangaalen@iag.tno.nl for mail to my office and BIG files
or: pa2aga@iag.tno.nl for letters only, NO BIG files here

: I don't have much of a problem with the above transaction, and
: in fact, since this is all third hand, I wouldn't give it much
: thought. I'm a advocate of removing dedicated services from
: user accessible frequencies. (like links)

: What *did* raise my eyebrows (and tell me what you think about this).
: It seems the OO who cited the amateur for violation of the bandplan
: is ALSO the President of the same group that AUTHORED the bandplan!
: This easily can be confirmed and apparently has existed for a while.
: With over 26 OO's in Michigan (and 9 in the area in question) it
: seems to me there shouldn't be any need for this OO to have to
: enforce his own bandplan. While, from what I've heard, this
: in minor compared to some other OO transgressions, this perceived
: conflict of interest bothers me.

It could also be a situation where someone really was in the
know about the MOST recent bandplan. (This is speculation...)
but it doesn't necessarily seem a conflict of interest. Just
depends on which spin you wish to place on it.

Oh...I better reveal my stripes...I'm one of your infamous OO's.
I've been an OO Coordinator AND a Section Manager so I have some
idea of the standards that I used for appointing OO's.

Some facts...last time I looked there were about 700 OO's in the
entire country. In my section(Santa Clara Valley = Silicon Valley)
there are perhaps 7...so 1% of the countries OO's live here.

These guys tend to divide into two categories...the type that Thunt
2m problems, and the type that prowl the HF bands listening for
key-klix problems, etc.

The ARRL standards are that the individual has been licensed 4 years
and they must take and pass a test that is designed to self-training
the OO. My personal additional screen was that I was looking for
someone that didn't really want the job, but knew it had to be
done, i.e. not over-zealous. There was a case in a near-by section
where one OO ran up a bill of 40 to 50 bucks in stamps per month....
that is overzealous! He was removed by the responsible section
manager. If the applicant was unknown to me, then he had to
find two folks that I did know to write him letters of recommendation
for the job. Now, this isn't ARRL's policy, but one I followed
to try and weed out the band cop types.

: marty@trucom.com (Marty Albert) wrote:

: >The specific issue in question is if a 2m backbone is in violation of
: >THE RULES. It clearly is not.

Well, if there is an extant bandplan, and the guy was putting
up a backbone outside that bandplan, then an OO card is in
order. HOWEVER, let's all remember what an OO card is....
it is the OPINION of another amateur about some operational
characteristic that they have observed. It isn't the ARRL
saying there is a problem, nor is it the FCC saying there is
a problem..it is the single OO saying that in their opinion,
there was a problem. Sometimes, OO's do forget that, and VERY
often, the recipient doesn't understand this...they take it
far more seriously than they should...kind of like getting
an electric shock!

There is also an art in writing these little cards... if you
write them in factual, succinct terms, they come off as bombs!
If you write them couched in "Could be's" and "Perhaps's" then
then effect isn't quite as electrifying. The intent should be
like tapping someone on the shoulder and whispering a warning
in their ear, not a trumpet blast into same.

: >The problem is that OO's come in three basic "flavors"...
: > (1) The good ones that know what they are doing and actually act
: > upon Part 97.
: > (2) The ones that blindly follow the ARRL's opinion (note I did not
: > say 'interpretation') of what Part 97 _should_ be.
: > (3) The vindictive ones that hate anything they can't understand.

: >Sadly, Flavor #1 appears to be the smallest group.

: >On a more global scope, the entire idea of the Amateur Auxiliary and
: >Official Observers is, pardon my directness, crap. How would you react
: >if, for example, the IRS just turned loose a bunch of people off the
: >street that would be able to decide if you should be audited? Same
: >thing.

The IRS isn't the issue here, but whether the Auxiliary performs
a useful purpose. With the FCC hanging up their guns...the OO
program thru peer pressure is about the only thing we have left,
and it has severe limits (peer pressure only goes so far.) Me thinks
that you've had a bad experience with one OO, and are painting all
of us with the same brush. I respectfully submit that that
isn't fair either.

: Most of the ones I have known fall under "Flavor #1". But even one
: bad OO is one to many in my opinion. We have to hold our law enforcement
: personal, be they volunteer or not, to high standards.

Well, here is another mis-conception. We aren't "law enforcement."
OO's don't have any special privileges or powers. They are just
other hams. When THEY forget that is when they get into trouble.

: >The other OO who has sent me at least 5 notices has a problem with
: >packet bulletins about recipes and hobbies. To avoid further
: >embarrassment to him and the ARRL, I won't give out his call sign (he
: >knows who he is and he reads this group), but after filing official
: >complaints with the ARRL, FCC, my Senators, and Representative through
: >my lawyer, this OO and the ARRL decided that discretion is indeed the
: >better part of valor.

No comment here...I didn't see the bulletins. It is also true that
what can and can't go into a packet bulletin has changed RADICALLY
in the last 5 years. I've written more than one OO card to guys
offering 16 speed blenders for sale via packet bulletins 6 years ago.
Today, that would probably be okay. The rules have been a moving
target of late.

: It would be interesting to see what if any corrective action the ARRL
: took against the OO that was harassing Marty. Possibly a promotion? ;-)

: >With the current House Resolution that would remove all responsibility
: >from the OO program, we are in for real problems. (I have misplaced my
: >note with the number of the HR...) I would encourage ALL Hams to drop
: >a note to their Representatives asking them to stand OPPOSED to this
: >House Resolution and to mandate that the FCC do their job, not
: >delegate it to non-public agencies or individuals.

: >Take Care & 73

: >Marty Albert
: >marty@trucom.com

I again respectfully disagree, but then, I'm obviously a beneficiary
of such legislation....so I'm not exactly un-biased.

: Its H.R. 3207. You can find your representatives e-mail address at
: http://www.house.gov

: Steve Wolf <no8m@apk.net> wrote:
: >
: > The OOs aren't the bad guys here. The ARRL isn't either. You are
: > not dealing with a person with 20 years of law enforcement training.

: Steve, let me ask you this since you are a Assistant Sectional
: Manager for the ARRL in Ohio. What kind of screening does the ARRL do
: before one becomes a OO? Are there background checks
: on the OO? Educational requirements? Drug testing? Do you offer any
: kind of training to the OO? All of the above are required for FCC
: agents in similar roles.

Drug testing? I believe I've answered the training questions
previously. A further note here might help. The training manual
is approved by FCC. OO's aren't FCC agents. They have NO enforcement
powers, they have NO arrest authority, they have no citation
authority. They are other hams applying peer pressure, that is all
they are.

: > An OO is a volunteer trying to help the hobby. He goofed. Big deal.

Whoops...an OO was human...watch out ;-)

: Understood. But with the recoprical agreement the FCC has with the ARRL
: for rule enforcement and now the pending House Resolution 3207, the
: OO's are going to be holding awfully big sticks. I, like many others,
: are concerned. More accountability is needed with the current program.

See above...you are assigning WAY more power to the OO program than it has. In fact, truth be told, the OO program is a pretty demoralized bunch at the moment due to the FCC hanging up their guns. When a problem DOES need to be referred to FCC for action because peer pressure doesn't work(chronic situations), the FCC is out to lunch, and has been for a couple years.

I downloaded KaWin the other day and tried it out with my KAM. I have to say, it is an EXCELLENT program! It has features too numerous to mention and is VERY intuitive, especially compared to other host mode DOS based apps I've seen (keyboard Twister game skills not required).

The question I have is how many of you paid the $80? I may give in to peer pressure and buy it if others also think it's worth the money, but it will take some serious thought to spend that on hobby software.

If it were $30, I'd buy it in a heartbeat.
If it were $50, I'd think about it, but still buy it.

Any other opinions?

Hello!

Beeing able to borrow some complete setups with Grapes 56 KB modems,
TNC-2s, Transverters, it is quite annoying not to bring em on the air!

I've found TNC-2 docs on the web, it will take me to sleep in just
some minutes, but I'm convinced these TNC's have the KISS 56 ROM,
generated by burning from a diskette, that no longer exists with
the equipment :-(

Any clues to these things are greately appreciated

John,
I did and I have found it to be a fair investment.

I played a small part in the beta testing of KaWin
and Stan put the effort into this package.

I sorta look at it like this... I have a $600 in Kam TNCs,
a few thousand plus in radios, a grand or so in antennas
so 79 or 80 bucks is not so bad.

An old friend once told me...
It just cost a little more to go 1st class....

I have found KaWin and Stan's support to 1st class...

I have it too (shareware), and like it very much. It supports my dual port
9612, which is the main reason, but you are correct...it has MANY great
features also. The best Win based packet software Ive seen.

>The question I have is how many of you paid the $80? I may give in to

>Any other opinions?

This is exactly why I dont have a registered version. While I believe in
software copyright laws, I feel $79.95 is too high a price for communication
software. Heck...I bought a used KPC-3 at Dayton for $60.00, and cant see
paying more for the software, that runs the hardware.

I feel they would benifit themselves by offering it at a lower price, because
of course, more would buy it, hence, their profit line would increase in the
long run.

Just my 2 cents...take care all.

>Any clues to these things are greately appreciated

In addition to having the KISS56 ROMs, the TNCs need to be
"hotrodded" with B level parts and a faster crystal to work
with the 56 kb modem. Even then, while they'll handle 56 kb
bursts on the radio side, you'll only be able to run 19.2 kb
on the serial port side. As you can see, that won't allow
you to get best use out of the 56 kb modems.

I'd strongly urge you to get a pair of the Ottawa PI-2 cards
instead. They plug right into the PC, use DMA, and can support
the full 56 kb of the modems. GRAPES no longer recomends using
modified TNC-2s. They were an expedient at best.

Hello to all...

Although most postings to this list and others to which I subscribe are written well, there are many postings by native English speakers which are an assault on the language. The primary culprit is poor spelling, and in this day and age of spell checkers (and, God forbid, dictionaries!) there should be no reason for this poverty of spelling. Yes, all of us, including me, will make spelling errors, mostly due to typos or just plain carelessness, but the errors of which I speak are the result of just not knowing the correct spelling and not bothering to find out. I can tolerate errors of grammar and syntax, but the spelling is a real killer. We have some very bright contributors to this list, folks, so I don't think it is too much to expect good writing. Please read what you write before posting, and, if corrections are needed, make them. To do otherwise is to display one's inability to speak and write in his native tongue.

To those for whom English is a second language, you do well, my friends, and often better than those of us who should know better!

If I've offended some, so be it, for that is the teacher in me. I learned a powerful lesson early in my career: If you can't put into writing with clarity that which you are thinking, you have no idea fo what you are thinking. I wish I could take credit for that thaought, but the credit belongs to a freshman English composition instructor in college some 35 years ago. It was expected that since we were in higher education, we should be able to speak and write properly. This has never gone out of fashion, contrary to what popular opinion or culture may think.

Please keep the fine materials and discussions flowing, but do so with good language skills.

73, Ed, K1BYV

Errr, check 97.305. Data emissions are *not* legal in the US HF
phone segments (except on 160m). Amateurs could more fully utilize
the authorized data transmission band segments, but the CW operators
who tend to hang out in the lower parts of the data segments might
not be pleased.

>The good news is that we have generally good local and regional

Yeah, tis a pity, but considering the dismal performance of current
HF packet systems, there's little wonder that is so. If we hope to
have effective HF networks, we first have to fix that which is broken
the worst, and that isn't ARRL support, that's the lousy protocol
and modulation method in use.

> >Any other opinions?
SNIP

Hmmmm....

The cost of development for a project like this would be...

PC 3000.00 (it ain't not toy dos box)
Visual Basic Dev tools 500.00
Labor 52000.00
Misc (paper ink...) 2000.00

Total est cost 57500.00

Number of copies to be sold to break even: $57500 / $79.00 = 727.85

Labor guess.
2 years work at 5 hours a day 5 days a week equal 2600 hours effort.
Let say Stan wanted to pay himself entry level programmer's salary
of 20 dollars and hour. The labor cost would run 2600 * 20 or $52000

In the real would you would have to double the 52 kilobucks to
cover such things as taxes and other employee costs.

Another way of looking at this would be to use the bean counters
view of about 10 dollar a line.

At 41000 lines * $10 = 410,000.00 dollars (This figure is what
I would expect if KaWin was develop at a commercial site rather
than a labor of love :-)

The break even would be $410,000 / $79.00 = 5189.87 copies.

How many Kam users are there???

In my dealings with Stan, I have found him to be a professional
software engineer and not a hacker. His work with KaWin reflect
his abilities.

When you want something for low cost or free (read pirate)
stop and think... What am I going to give in return for
all the time, research and effort in exchange for the
work the author has put into his/her project.

My 2 cents worth...
Dennis Mobley KT4FI

ps. Note, I did not include the cost of the outstanding
beta test site that Stan utilized for quality control.

Hi Mike!

It looks as though you're wanting to come up with some sort of
microwave communications for house-to-house use which doesn't
come with unsightly dishes on masts. Maybe if you come out and
describe what you're really trying to do, you might get some more
specifically useful help.

In general though, you're going to have no fun at all trying
to pump microwave signals through a sloped roof.

Think about it for a bit...

Where does the part of the signal that doesn't make it through
the roof go? It gets reflected *DOWN*. This can generally be
regarded as A Bad Thing=AE, especially in the case of residential
structures.

I have a few questions about building digital communications link (tranceivers) for fast data
transfer by shortwawes (or other).I have not much experience working with this area so next some
simple questions.

- What would be the most economical transmitter power/frequency value to transmit digital signal for
few tens of kilometers.

- How fast would then be the data transfer rate?(In fact,I'm interested in how many wawe cycles are
required to transmit one data bit at current frequency.Do I have to use modulation of the carrier
signal or can I just send the digital data stream as on/off "bursts" of the carrier.At the whole,what kind of system would it be to get this kind of thing working?)

Excuse me for unprofessional language (and not correct english :))

Please answer to this NG and also directly by E-mail (I cannot read these regularly...)

Thanks,,

>this.

Technically, you can access all areas of the internet, but there are legal issues regarding content and third party participation. You cannot use amateur radio for commercial content, and non-amateur messages to you fall under third party rules. With recent rules changes about content, these items have become grey areas. In essence, you *can* now access a commercial web page without violating the commercial content regulations as long as it isn't done a part of *your* regular business activity, IE it's Ok to read Netscape's homepage, but not Ok to download their SDK for your business use, but you could download it for amateur purposes.

>My second question is, I have been on some packet radio web
>sites, and on one, I saw something saying you can get T1 speed over
>packet radio, although it's not very common. Could someone please
>explain this to me too? Thanks.

You can do *better* than T1 via amateur radio, but right now you have to *build* the equipment. The fastest amateur radio *product* is 56 kb. Faster speeds require you to build the equipment yourself. That's permitted (even encouraged) in amateur radio. To do T1 or better, however, requires a lot of bandwidth, and the spectrum where that bandwidth is available is microwave, which has range limitations for terrestrial use, IE out to about 50 miles max in practice, usually less, because of the line of sight nature of the common propagation mode and the line of sight limit due to the Earth's curvature. If you can live with that, the equipment is relatively easy to build.

>- What would be the most economical transmitter power/frequency value to transmit digital signal for few tens of kilometers.

That's a complicated question. How fast do you want to go? Do you want to measure economy per bit transferred or just raw equipment cost? Do you mean economy of bandwidth consumed, or economy of capital cost, or economy of power used, or economy of transmission time consumed, etc?

Shortwave is limited, by regulation and by practical available bandwidth considerations, to a relatively low baud. For most of HF under US rules, the fastest allowed baud is 300. With some symbol overloading tricks, you can get up to around 750 bps on shortwave, but that's about the limit. On the plus side, worldwide single hop contacts are possible. If you buy new turnkey equipment, you're looking at about $1500 (US) to equip a station for the top data rate. You can do it cheaper by building your own equipment. Lower speeds don't cost you much less than the top rate, so there's little savings to be had by going slower, but lots of current amateurs *do* go slower for other reasons, so you might want to look at that in order to maximize the number of stations you could work.

At VHF/UHF, faster speeds are possible, up to 56 kb by US regulation. Single hop range is up to about 100 km depending on terrain and band chosen. Relay hops are practical, however, up to about 3 for realtime use, and virtually unlimited hops for non-realtime use. Equipment for a 56 kb station costs about $600. The most popular speed at VHF is 1200 baud, however, for historical reasons, and equipment to do that also costs about $600 (though cheaper if you scrounge used equipment or already have some voice grade FM equipment). Again, if you want to work lots of stations, you may need to opt for the slower speed.

For higher speeds, T1 or greater, you have to migrate to the microwave bands. All the equipment here is homemade. Cost can be very low, a few tens of dollars, but range is limited to line of sight paths. There are *very* few stations doing this, so your opportunity to work other stations will be very limited. It would be ideal for a dedicated link, however.

>- How fast would then be the data transfer rate?(In fact,I'm interested in how many wawe cycles are
>required to transmit one data bit at current frequency.Do I have to use modulation of the carrier

>signal or can I just send the digital data stream as on/off "bursts" of the carrier.At the
>whole,what kind of system would it be to get this kind of thing working?)

Again this is a complex question. In raw Hertz per baud, MSK is the
technique of choice. The 56 kb RF modem achieves 1.4 Hz/baud using
MSK. Symbol overloading can allow higher bps for a given baud of course,
so for example, if you were using Clover modulation you could get up to
0.667 Hz/bit on a good propagation path. On the other hand, the very
popular AFSK over FM requires 16.667 Hz/baud.

OOK (On Off Keying) is not desirable for a number of technical reasons.
The modulations used by amateurs include FSK, AFSK over SSB (functionally
identical to straight FSK), AFSK over FM (a double modulation, which is
popular but very inefficient), MSK, PSK, FSM, etc. Each method has its
benefits and costs. You would select a particular method based on a number
of criteria too involved to address here.

HOLY Baudrate Batman! Sorry son, you'll find 99% of the old-fart radio ranks at half-duplex-1200 baud or less... There are one or two isolated areas where a few may be running 9600 or even 54K but unless you are very lucky to be in one of those areas you'll be looking at 1200 baud with typical 20 to 60 character/sec thruput. Not really the best environment for web pages, or much else for that matter. One problem is that figuring out how to make a cable to connect a 1200 baud tnc to the external jacks on a radio is about the technical limit for most hams. The market demand for higher baud plug-n-play equipment simply isn't there, so neither is the equipment. Check back in about 30 years, (IF there still ARE any hams by then) we might be moving along by then...

As for internet access via ham radio? Maybe. If you can find someone who doesn't mind putting their license on the line. It's pretty easy to see why the FCC would consider gateways illegal. Third party international traffic, advertising, profanity and probably more. With the draconian restrictions on ham radio digital modes most folks are reluctant to provide open gateways. There are a few heavily restricted access points but i doubt these are all you have been led to think they are.

-be

Good luck with the ticket, my friend, but if your interests are in digital communications, you'll find (for the most part) ham radio is 10 to 20 years behind.....

-be

:>Bob N6RFM
:>rjmatt@world.std.com

Hi Bob

Well, I am using a DSP-232 and had lots of fun trying to get Winpac working. I finally managed to klunge together the PK232 and PK96scr sets and had the first line as expert on the very next line was dcdconn on. The very last line is expert off. I then did an initialization which worked. Just have minor tweaking to do to get it working as well as TPK.
I have had some prblems with the fuse blowing. There have been two very close lightening strikes. Nothing was damaged or seemingly hit but I did notice that the leds were off on the TNC. I checked and the fuse was blown. I replaced the fuse and it did it again during the next storm. I finally phoned up AEA to check it out and was told that the 1 amp fuse (which is clearly labeled for a one amp fuse) - (and shows up in the schematic as a 1 amp fuse as well) should in actual fact be a 2 amp fast blow. As soon as it pops again I will replace it with a 2 amp. They also phoned me up when AEA received my registration card because I had put in that it would be nice to get some sort of packet program with the unit and AEA said that since unit # 300 they were giving away the Packet program for windows the normally would sell for $100. I haven't yet tried other modes because I haven't gotten the cable for radio 2 port. One of these day!!

Anyway, it looks nice, It seems to be working very well on the VHF packet side. If I ever get some kind of 440 rig I will be trying the 9600 baud side of things.

Good luck

73 de john

Who needs terminal software for this old lapt-top? It has a terminal
program built into ROM. I was always under the impression that
people using packet got along fine with dumb terminals for their
TNC's, and it's only in more recent years that programs that turned
your computer into a terminal specifically for use with a TNC were
written. Face it, when packet first hit the air back in 1978 or so,
there were relatively few computers out and about. There was still
a market for baudot machines, and model 33 ASCII teletype machines
were in great demand, not only with hams wanting to put them on
the air, but also with computer hobbyists needing cheap terminals
and hardcopy for use with their newly built home computers.
So back then, when people talked about using terminals with their
TNC's, they just might simply be using actual terminals, not computers.

So try the terminal software built into the Model 100 before looking
for fancy software that may or may not exist.

3673. NEW SOFTWARE: TNCEmu 1.0

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-12 00:00:00 UTC
From: cramirez@hercules.uca.es
Message-ID: <4s5ce8$afa@erika.cica.es>
Source record: 35869

I've just uploaded TNCEmu 1.0 to ftp.funet.fi. You can find it probably at /pub/ham/packet/misc or /pub/ham/packet/baycom.

My program is very simmilar to PC-TNC: it emulates a TNC with a PC+modem. It provides WA8DED, TAPR & KISS emulation. As PC-TNC, you must connect this PC to your 'host' PC through a null modem cable. It provides hardware handshaking too. Finally, it can handle 3 driver types: BPQ, TFPCX and BPQ External drivers (for KISS).

Hope you will find it useful! (and sorry for my english :-)

If you do not like the price, put it back on the shelf.

Lame reasoning, based on speculative information, gives no person a moral justification to something for nothing, or at a price set, unilaterally, by the buyer, for a piece of someone else's life. Slavery was formally abolished.

It still amazes me that supposedly rational creatures, in a market driven economy, can still justify, in public and private, theft and sponging based on their personal disagreement with a seller's price/policy.

If you are sponging or stealing, you are a parasite, and all the sophistry at your command will change nothing.

Keep up the good work, Stan. I suspect there are those that consider the price well worth it, considering the quality of the product and the total amount of your life invested in acquiring the skills and knowledge to create it. I have nothing for sale to compare.

3676. Need 9600+ baud radio recommendations

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-12 00:00:00 UTC
From: jbarr@MCS.COM
Message-ID: <4s5tg0$ar5@Venus.mcs.com>
Source record: 35872

I have a simple 1200 baud packet station set up using an Alinco HT and am MFJ TNC. All works fine. That said, I would like to explore the world or 9600 baud and higher Packet radio, but have noticed that the only radios that seem to support 9600+ baud are "expensive mobil rigs". OK, let me elaborate on that. MFJ has a VHF data radio designed to run from 1200 to 9600 baud packet in the VHF band. The radio costs a bit over $100.00, and from several reports is a VERY reliable radio solution for a dedicated packet station. OK, now for 9600+ baud. As I understand it, due to bandwidth issues, 9600+ baud really needs higher frequencies such as UHF.

My questions are:

What radios are recommended for a dedicated 9600+ baud packet station?

Does anyone make a dedicated packet radio like MFJ's that would "do 9600+ baud packet" inexpensivly?

Are there any resources (Web, etc.) that would give me more information?

I know that the organization in Chicago called CAPRA has high-speed backbones running and offer high-speed access points. OK, so maybe I should just contact them! ;-)

3677. deviation setting on PK80?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-12 00:00:00 UTC
From: bat@gateway.grumman.com
Message-ID: <4s61u9$79t@gateway.grumman.com>
Source record: 35873

I recently got a PK80 (not an 88!) for almost nothing.
It seems to work fine. But, the packet deviation to my kenwood radio
is about 4.2K, just a little too hot for packet. I have no docs on this
(I told you it was cheap), so I need to know what pot controls the
deviation. What is its designation, and where on the board is it
located? luckily, I have a nice old Heathkit deviation meter, so
setting it won't be bad. TIA. -pat

>questions is unimportant. Hams have chosen to use the telephone
>instead of Ham Radio to do these things."

First off, I am not directly involved with HF digital work, only VHF
and up...

However, the problems in HF digital traffic handling have had a HUGE
impact on the more local VHF+ operations, and so I offer my comments
here...

My personal opinion is that the reason that so much traffic is now
being passed via Internet is because of the lack of support of HF
digital operations by the ARRL. In other words, it is not so much that
folks have made the "choice" to use Internet forwarding and it is that
they have been "forced" to do so in order to move the traffic in some
sort of a reasonable time period, if indeed at all.

There are those that will argue that this places the "message before
the medium", but what good is a network that takes weeks to transfer a
message from Europe to North America?

Just my opinions.

If you question that Stan could have spent 1000 hours on KAWIN, then you perhaps have not written and debugged much Windows Software. Stan and KAWIN are part of my competition, but I have to defend him in this case. The price of software to a great extent is determined by number of units sold, ie.. size of market. The market for Amateur data comm software is small, and I suspect shrinking (people are on internet instead of packet radio, I wonder why?). Stan's market is limited to only people with Kantronics TNCs. The WINPAC freeware product (editorial comment deleted), my Visual PacketPeT product and a number of other shareware and DOS products like KAGOLD (which has a lot of users, even though it is a DOS product), are all breaking up this already small pie.

The market is too small to support the number of products that currently exist, and I suspect that you will see some of the players dropping out of the game in time. You would see a lot more ham software if people could make a living off it, and therefore devote 8 hours+ a day to it. But with such a small market, people do it as a hobby or sideline, but

that doesn't mean their time isn't valuable. (Visual PacketPeT has over 4 years of work in it, and way way beyond 1000 hours of work!)

Even as a sideline, the author of a product should at least be able to recover the costs of development. I am sure that many amateur radio related software products are still not at that break even point. How do you think that will effect future releases, upgrades and the development of new amateur radio related software products?

I urge users to support the developers of amateur radio software products!

>Any clues to these things are greately appreciated

The KISS56 ROMs work pretty much the same as a standard KISS-only ROM, except that the timers (TXD, etc.) operate in 2.5ms increments rather than 10ms as is standard. So, set your TXD, TXTail, and slottime to 4x the values you normally would and you should be all set.

We use the KISS56 ROMs in PacComm Tiny-2 (TNC2 clones) with good success on a 19.2kb network.

If the only people that know about a bandplan
are the people that are enforcing the bandplan, it doesn't seem like
much of a bandplan to me. But then a debate about the proper
palimentary procedures a frequency coordinating body should follow
is another issue.

So, the program is alive and well then? You get the impression from
the ARRL bill, opps, sorry, the Baker bill that the OO's are dropping
out of the program left and right due to lawsuits against them.

>
> The ARRL standards are that the individual has been licensed 4 years

Is this the same test that is cited in Public Law 97-259 that the FCC
requires amateurs to take to assist in enforcement actions?

Drum roll please... THIS IS EXCACTLY the kind of responsible supervision
that I feel should be a part of the OO program. However, we must MANDATE
to the ARRL to require these minimal screening requirements for those we
chose to 'have the ear of' the FCC. And yes, you are correct. In a phone
call earlier this week to Jay Maybee of the ARRL, I asked him what screening
was done of prospective OO's. He indicated none. When asked if any was
planned for the future, he indicated no. Any thoughts on how we can keep
the over-zealous and 'bad cop' types country wide?

Your right, they don't have any special privileges YET. If HR 3207
passes, they will have special protection under Federal Tort laws. Public
Law 97-259 allows the FCC to 'call upon' amateurs in enforcement matters.
They are providing data to the FCC in direct support of enforcement actions.
Abusing this position could have devestating effects on others. Before the
U.S. Congress decides to provide Legal Welfare to these volunteers, I really
don't think it is to much to ask to require some sort of screening process

to be in place.

Steve, I wouldn't expect you or any OO to object to the current state
of the bill. You obviously have alot to gain from it. However, I think
a bill could be crafted that would protect you as a OO while at the same
time enhancing the quality of the present program. There are many
misconceptions on this bill, mostly due to inaccurate and mis-leading
press releases. I suggest besides reading H.R. 3207, you read the
Federal Tort act refered to in the bill along with Public law 97-259.
The bill is flawed and shouldn't be passed in its present form.

> : Steve, let me ask you this since you are a Assistant Sectional

> Drug testing?

Why do people get bent out of shape about this? Your about the third
guy who has questioned this. I of course was refering to illegal
drugs. Its a matter of character. If a guy can break the law with
illegal drug use, how can we trust him to follow other laws. For
laws to be effective, they MUST be absolutes. Its when we start
to use our "judgement" whether to follow a particular law or
not is when we run into trouble.

BTW, I don't want to get in a big debate about this. While I abhore
any drug use, I think *all* drugs should be legal (yes, I am one of
those raving Libertarians :-). If someone of legal age wants to
blow their mind, who am I to stop them. But the question here is one
of higher standards in the OO program.

> I believe I've answered the training questions
> previously. A further note here might help. The training manual

> bunch at the moment due to the FCC hanging up their guns. When a
> problem DOES need to be referred to FCC for action because peer
> pressure doesn't work(chronic situations), the FCC is out to lunch,
> and has been for a couple years.

Likly you are right. I want to thank you for answering many of my questions.
I also believe we largely agree on this issue of higher standards for the
OO program. But the question remains is how do we get the ARRL to have
some limited set of standards for OO's? What you said you did in your
own district to ensure high standards for the OO's would go a long way
into reducing the fears I have against H.R. 3207

Has anyone ever considered just getting the FCC to do there job? Even us
Libertarians think a basic function of government is to enforce
the laws. Why do we need some crazy Legal Welfare Pork (H.R. 3207) when
we should just focus on fixing the problem. What AMAZES me is this was
proposed by a Republican.

I think the point was that one reason the program has such a small
market is the price. Borland showed that if you priced software
"like a book" it would sell to a much larger audience. But that
only applies to programs with a large *potential* market, and you
make a good point about this program being aimed at a very small
niche market.

I think this is one of the problems with the amateur radio software
market. Each developer seems to want to include the kitchen sink in
his program, and then target it to a very narrow niche application.
This marketing model isn't a very good one. What the amateur marketplace
needs is software components which can be "screwed together" to form
a desired system, much the same way amateurs assemble a station.

Amateurs don't demand that one piece of equipment do *everything*,
and then add other pieces of equipment that do everything too, rather,
they expect the various bits of equipment they purchase will cooperate
to do what they want done. For software, this is the unix programming
model as enhanced by the Smalltalk inspired ideas of class and inheritance
inherent in modern software engineering. (Or more concretely, the Netscape
model of plugin helper applications forms a model that could be applied
to amateur digital communications software.)

When enhanced functionality can be added by the amateur by purchasing
and installing a new functional block, the redundant coding effort
of developers will be lessened, the functionality available to a wider
range of potential customers will be enhanced, and costs can come down.

Gary

Whoa!! That illustrates my previous point very well. How in the
world can a TNC management program possibly justify 40,000 lines
of code? That's obscene.

>>then I expect you will also have a problem with the wrong (that is,
>>supposedly supressed) sideband jamming the incoming correct sideband.

And you could avoid the whole problem by simply using two half rate
signals on the two sidebands, both in the same direction. (This is
a thought experiment, as there are almost certainly better ways of
doing things.)

>The whole idea behind this toy idea is to use as little as possible of
>the RF bandwidth. My theory is that if you bandwidth limit data, pass
>each direction over one SB using a carrier, you effectively halve the
>bandwidth on the air. From what I have seen, FM, AM, DSB, and every
>other method that everyone uses takes up twice the bandwidth of the
>spectrum relative to this idea.

I think you are taking too simplistic a view of the technology of
transmitting data over an analogue channel. Amateur equipment may well
take a simplistic view, but that is because it has to be done with
relatively low technology. The technology needed for your system would
be very complex over a lossy radio channel. (Incidentally, theoretically
there is no reason why you need to use the other sideband for the return
path, as on a radio path, in theory, and on a telephone circuit, in
everyday use, you can subtract out your own signal completely.)

One of the approaches used in phone and radio modems to get round your
problem of sidebands is to send half the bits with one carrier phase and
half the bits with a 90 degree shifted carrier. This is effectively
done as double sideband suppressed carrier. I guess there is some
redundancy to allow carrier frequency errors to be tracked and there may
even be pilot carriers in radio systems. Note though that by suitable
coding you don't need an absolute phase reference, you use phase difference
from signalling unit to signalling unit (all of the medium and
high speed modem codes do this).

>It works now, albeit with wire.

As I hinted above, with wire you can, and all modems from V.32 upwards do, get the reverse channel in the SAME frequency range as the forward channel, so your system is only using half of the capacity of the wire link.

>I agree that suppressing sidebands is a relative pain, but, if it
>utilizes bandwidth better, and you can do it cheaply, why not?

Doing it cheaply is the problem. Better modulation schemes with wider frequency separations between send and receive are a much more practical solution.

Incidentally, I sense a tendency to think in terms of bit rate equals baud rate. In an ideal world, you can get any given bit rate into an arbitrarily small bandwidth (the V.34 modem you are probably using is getting 28,800 bits per second into somewhat less than 3,000 Hz of bandwidth. Your simple AM suppressed carrier model will probably only get rather less than around 6,000 bits per second into this bandwidth and a realistic figure would be more like 3,000 (given that real telephone channels are not ideal 3.1 kHz channels, the practical limit is around 2,400 for baud rate = bit rate and analogue technology.

From a theoretical point of view, you need to consider a combination of bandwidth and signal to noise ratio. (The ultimate limit on modern telephone systems is set by the quantisaton noise from the PCM coding.)

>
>
>The problem with digital (IE PLL), is that ultimately you have to
>convert digital back into a single frequency. This is no trivial
>matter. I have used all kinds of methods to achieve a real pure sine
>from a square wave and it COSTS money to do.

The only place where you need a pure sine wave is for the transmitted signal, and that will normally have the harmonics well separated allowing much simpler filters than those needed to knock out a carrier at ZERO frequency offset (baseband digital data extends down to zero, not the 300 Hz of speech, although by scrambling, you can even out the power across the frequency range, and by bit stuffing and more general run lenght limited codes you can sacrifice a few bits to remove the zero frequency component altogether).

For mixing and synchronous detection, you may well WANT a squarewave!

Actually the presence of low frequency components means that you can't construct a filter which won't also damage the signal. You have to use codes which have a higher baseband spectrum, and therefore a wider RF one, relative to your pilot carrier, in order to filter them with real filters.

>The whole idea in this toy endevour is to produce a very minimal
>relative spectrum usage full duplex data channel, using VERY cheap
>components. I found that you can modulate digital at any frequency,
>and not need any exotic modem's, DSP's, etc. You just play with

>digital edges. The spectrum thanks you too.

All the above has assumed that you are using shaped pulses. Raw
square pulses will require rather more bandwidth. Or are you talking
about differential coding?

>If I can get this system working at about 16 to 25mhz, then it should
>also work at any higher frequency. I would like to make it work at HF
>and then play with bumping the frequency up.

Actually you need to start at VHF and work downwards. HF is subject to
time varying differential phase delays (and selective fading) which make
baud rate = bit rate systems almost impossible at much over teleprinter
speeds, except, possibly, for line of site paths. If you look at
Clover, you will see that it actually frequency division multiplexes
several very narrow (quadrature phase shift if I remember correctly)
channels. Direct QPSK at microwave can work at megabits per second.

Basically there are well known techniques for reducing the bandwidth
of a modulated digital signal. These vary from simple quadrature
phase shift keying, which can be decoded without DSPs, to the complex
schemes used in V.34. However, using wide frequency splits is so
much easier a way of obtaining full duplex than attempting to send
and recieve without any effective frequency separation, and uses no
more bandwidth in total.

You want to treat this as a learning exercise, to give you a real feeling
for some of the issues, but now is the time to consolidate that by getting
and reading a text book on electronic communications theory.

3691. KPC-3/9612 PBBS help.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-13 00:00:00 UTC
From: cgreenha@magnus.acs.ohio-state.edu
Message-ID: <cgreenha.392.31E7D06B@magnus.acs.ohio-state.edu>
Source record: 35887

Hello all.

I have a KPC-3, and 9612 TNCs. My question is this;

Does anybody know a way of reseting the PBBS back to message number 1,
besides doing a hard reset?

I thought that I have done it before, but after much playing, cant figure it
out. The PBLO command only alters the order in which they appear, and even
if I empty the mailbox, the next message takes the next number in line from
the previous deleted message.

Any help?

Thanks much.

As one of the developers of KaGOLD (and PkGOLD) I will also agree with the comments about the size of the market, the resources needed to design, develop, document, debug, and distribute any software product.

The sheer number of machine configurations, with different drivers, hardware setups, radios, the knowledge level of users, what users want (preferences) is a combinatorial explosion problem. This is one of the reasons why Windows is a good environment -- it uses (relatively) common dialogs, which makes the interface with users more intuitive in some cases, and it insulates the developers to some extent from being concerned about hardware -- monitors and printers being the most relevant "windows supported" hardware to a packet and HF non-packet type program. Unfortuantely, Windows has no built-in "Plug & Play" support for TNCs, or the many Radio interface standards avaialable.

At InterFlex, we deal with government users from many areas, including the U.S. Forest service, FEMA, military, police, public works departments, relief agencies, commercial users, and amateurs worldwide with a variety of computer setups. In a significant number of dedicated environments, Windows is not used, which puts us in the position of having to support DOS systems and Windows and OS/2.

Because of the number of users running our software in Windows and OS/2, we have put a number of "multitasking aware" features in our software to make it run in Windows with as little impact on the system as any Winapp, and run in the background, foreground, etc., and still deliver multiple sessions, conferences, file transfers, dual port operation, etc., and being a non-windows application, many of the windows messages (events) do not impact the performance.

For us, we find that many users are unaware of how Windows handles non-windows programs, and that if written to be multitasked, a DOS app can run very well in Windows. They are often surprised to learn that ALL winapps share a time slice, and non-windows apps get their own to manage entirely independently of the windows message system -- hence its often much faster that some of the Winapps. And we find that many users are not aware that some of the "winapps" available are written in Visual Basic (VB), which does not compile to native machine code, but to a p-code, or interpretive code with an "exe" loader.

In any case, all software development is a major undertaking. Microsoft is often reported to have people working 18 hour days, camped out at the "Microsoft campus" (giving CAMPus a new meaning).

And to make a program that appeals to everyone is very difficult. How often have we heard "I hate Windows 95" when in fact, its a lot more stable than Windows 3.xx, but it's different.

Developers do their best to develop and maintain sofware. Often, users think "It's only a disk, here's a copy" or believe that software is not worth much, yet software is what drives the TNCs, and Modems they use, the ROM code in the "hardware" is what distinguishes one manufacturer from another. AEA and Kantronics have different looking boxes, but the most important difference is the ROM code inside -- software. If we could just package up our user software in steel boxes with LEDs on it !!

We're all competing, we all have different ideas, and sure, we all want users to know about our products. Netiquette tells us not to hawk our wares on Newsgroups, so we have refrained from publishing "KaGOLD news" here -- yeah, we did it 3 or 4 times to announce our web page, but basically, it's frowned on, so we don't do it very often.

I hope I don't get a lot of heat for expressing a few ideas here, I don't do it often, but I read the comments about software, and yes, to write several thousand lines of code to support relatively unique hardware, especially TNCs, is our experience, and clearly the experience of other developers. And some of us develop code that uses the TNC's HOST mode, which adds another layer of complexity for developers, but gives users benefits like knowing TNC status (telemetry) about frames awaiting acknowledgement, errors, retry count, etc. It's hard work, takes long hours, but hopefully the users are benefitting.

According to TI, the last production run for the TCM3105 in plastic DIL
format was November 1995, and the last for SMD types was April 1996.
They have *no* plans for any more runs, it is officially a deleted part.

Source record: 35893

Re: Terminal Software for the Model 100 - It has a terminal program in ROM, which you can access from the main menu. You'll need to set the 100 to the same baud rate and format as the TNC, for example, 1200 baud 8 bits no parity, with xon/xoff handshaking, is a setup string of 68N1E.

The problem I found with the 100 is that the screen scrolls very slowly, which means that on a busy channel it is easy for the 100 to fall behind even 1200 bps packet (especially if other users persist in using lines longer than 40 characters).

I used a Model 100 for some time; but I've lately bought a somewhat more capable portable computer, so the 100 sits in a drawer mostly, unless I need to use it as a "fox box" for testing RS 232 devices.

-- You are, of course and unfortunately, correct. Stan did produce one heck of an application. We hams forget
that we are a relatively small market for most producers. Many still run low end computers for the same reason
we gripe about software prices. It's tough for many to justify the cost of state of the art for our hobbies so
we expect the sellers to knuckle to our concept of value.

-- Though I was extremely impressed with KaWin (as well as XPKAM) I've not been able to justify their cost for
my level of digi activity and don't use either at present. I suspect I will eventually register XPKAM primarily
because I still have a 286 laptop running DOS.

Jack is right about having your parameters stored in a text file... that can be VERY HANDY when things go wrong! But you don't need to do a hard reset to restore the pbbs message numbers to 1: Give the command PBBS n where n is the same as the current size of the pbbs. (pg 46 of KPC-9612 instruction manual... under PBBS command)

3704. looking for "Baycom" type SOURCE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-14 00:00:00 UTC
From: Jean-Luc BARRAUD <f1jek@amsat.org>
Message-ID: <31E94840.6E67@amsat.org>
Source record: 35754

Hello,

I am working on a project for wich I need to write the low-level HDLC
encoding/decoding. I have already done encoding with a 68705, but decoding is still a
mystery for me. I have seen a "BAYCOM" source code some years ago, but as I did not need
it at this time, I did not pay attention to this listing.
If you have any listing in any language for encoding/decoding of packet frames
on a single I/O line (without SCC or SIO), I AM INTERESTED.

Thank you.

This isn't right Gary. For 2m RTTY, data, and test (Sec. 97.305) the regs refer you to Sec. 97.307(f)(5)and(8). The 20 kHz limitation is on "unspecified digital codes." Specified codes (including packet) are permitted to go as high as 19.6 kilobauds.

Think about it... the manufacturers would not be gleefully advertising their "9600 baud ready" radios if they weren't allowed to be used on the 2m band! The current problem is our (ham's) own slowness to make the transition to higher data rates. You might buy a 9K6 radio and tnc, and then find you still have to run it at 1200 baud to have anyone to talk to! Bummer...

As to the orignal post referring to the "expensive mobile radios"... the Alinco DR-150T (9600 out of the box) is less than $300 at AES in Milwaukee. That's not much more than a new HT. It pays to shop around. Some older gear can also be modified with a little know-how.

Best regards, Stan/KD9BE

YO Guys..Wake up!!!! This man spent a lot of time putting together an
great product (hats off to you Stan.) For those of you who run KA-Gold,
how much do you have to pay for an upgrade.(KAWIN is free upgrade when
you register last time I looked!!)

How many other programs out there support 32bit systems like Win95 or
even more Windows NT..(by the way Stan the new stuff is great with my NT
box, super fast and NT dose not complain!!)

What I would really like to know is where can I find these cheap NEW TNC
bargains??? Have not found any REAL TNC's for under $130. and I can get
them at dealer cost!!

Well there is my thoughts and feelings 73's for now..

>dedicated packet station.

Yeah, it's Ok. There are also the Tekk radios for 70cm. Again, cheap
and ready to go.

>OK, now for 9600+ baud. As I understand it,
>due to bandwidth issues, 9600+ baud really needs higher frequencies such
>as UHF.

Uncle Charley says we can't be wider than 20 kHz on 2m, so the fast
stuff has to go at 219 MHz and above.

>My questions are:
>
>What radios are recommended for a dedicated 9600+ baud packet station?
>Does anyone make a dedicated packet radio like MFJ's that would "do
>9600+ baud packet" inexpensivly?

Well, Kantronics produced the D4-10 which could be pushed to 19.2 kb
straight FSK, but it's out of production now. Above 9600 you have to
forget about the audio modem and FM radio paradigm. You need a dedicated
RF modem. The WA4DSY (GRAPES) 56 kb modem lets you go as fast as the
law allows below 450 MHz. Above that are the ethernet over microwave
systems.

>Are there any resources (Web, etc.) that would give me more information?

Check out www.wa4dsy.radio.org for details on 56 kb systems.

Hello Christopher,
The only way I can think of doing it, is a hard reset. Before doing
the reset, save the TNC configuration by opening a log file in your
terminal program and typing "display", then close the log file.

After doing the hard reset, you can then upload the saved log file as
though it were a pre-prepared message, with the TNC in command mode,
and the TNC parameters will be restored to your origional settings
without having to type them in again, it only takes seconds. The PMS
however will be empty and message number set to 1.

It is always handy to have a disk file of the config parameters, just
in case the TNC crashes or locks up for any reason, it can save a lot of time.

Cheers,,,,,Jack.

From: Steven_Sampson@msn.com
Message-ID: <00001fec+000015d7@msn.com>
Source record: 35763

I've been using two of these for years, hooked up to two DRSI DPK-2 TNC's running at 10 MHz. While the speed is good (because only two systems are on the freq) it's not phenominal (sp?). It's about the same increase from 1.2 k to 2.4 k (two times) as 9.6 k to 19.2 k. That is, the speed increase is not that impressive. This has led me to conclude that anything less than 200 k at half-duplex is probably not going to interest anyone who's seen the internet. 19.2 is good for auto-ftp of various files, or chat, but it's not good enough for NFS mounts (Linux/Unix).

The D4-10 is not a good design around the frequency generation area. It will drift, thus it should be kept in a stable temperature area (like the home) rather than a unregulated repeater site.

Steve, N5OWK

P.S. The DRSI modems have been modified to bypass the built-in 1.2 k modem chip. The D4-10 needs TTL input, and produces + 9.6 kHz deviation on a high, and - 9.6 kHz deviation on a low. You can't even hear it on an NBFM rig, but can hear a peep on a wideband mode scanner.

Well, Kantronics produced the D4-10 which could be pushed to 19.2 kb straight FSK, but it's out of production now. Above 9600 you have to forget about the audio modem and FM radio paradigm. You need a dedicated RF modem. The WA4DSY (GRAPES) 56 kb modem lets you go as fast as the law allows below 450 MHz. Above that are the ethernet over microwave systems.

You may try setting PBBS to 0, which shuts down the internal mailbox and then
resetting it to whatever value you use. I think this resets the message number
as well. I'll try mine and let you know.

> explain this to me too? Thanks.

To answer your question, you can access the Internet via ham radio, but you can't access EVERYTHING!! In other words, you can't access your commercial account and do whatever you do on that account (or see email messages that are "risque" in nature) unless you use it exclusevely for ham radio (and even then, some ISP's will get frustrated with your SLOW connection to their system. I even had one hang up on me completely BEFORE I even had a chance to log in).

You CAN, however, access packet radio or the AMPRnet, which is TCP/IP protocols over amateur frequencies, via gateways. I use UUGATE as my gateway. The following URL has a complete list of Internet-to-AMPRnet gateways and should be EXTREMELY helpful. The information on this URL completely blew me away.

Check out this URL: http://www.ccnet/~rwilkins/gateways.html

Hope this helps!! :-)

The PBBS message numbers can be reset to start with message 1 as follows:

PBBS [F10] (with KaGOLD, Enter if in CMD: mode)

look at the setting, e.g. 75-K, or 5-K, whatever it is, reissue the
PBBS command with that number (if you don't want to change anything
else, like the size of the maildrop).

On my KPC I type:

PBBS [F10]
response is PBBS 75

PBBS 75 [F10]
response is OK

Then reconnect to PBBS, and voila, message numbers start with 1.

The Kantronics KPC-9612 is probably the best choice to provide both dual port operation, for expandability, and 9600 baud off the shelf. Depending upon how many users can anticipate, there are several BBS programs around with various degrees of difficulty and requirements for setting up. Is it a club project or something you will be running on your own? My suggestion is to contact the sysop of the BBS you currently use (or closest to you) and get some help from him/her and, by doing so, you'll be in a better position to get forwarding from that BBS once yours is operational.

If you need any specifics, you can email me. I have used a few of the programs but I'm nowhere near an expert HI. I'd be happy to do what I can.

Yes, you can look at the info-mac repository into the folder COMM/BBS/...
You can try Hermes or Public Address.
There are various solutions to put a Mac BBS system on the air and on
phone lines.
Netmac for the communication workstation and gateway with others via
TCP/IP servers or Appletalk servers.

In article <cgreenha.392.31E7D06B@magnus.acs.ohio-state.edu>
cgreenha@magnus.acs.ohio-state.edu (Christopher K. Greenhalgh) writes:

Hello everybody.

Thanks so much for the help in resseting my mailbox message numbers with
the PBBS command...it worked great!

Another question has come up regarding this thread tho...

One user (who wasnt aware of the PBBS command like me), made reference
about saving your current configuration to text file, which I have always done.

My additional question is this;

When I send ny config file to the TNC, it only resets the beacon(s) to one
line, even tho there are two lines in the file.

I think I know what is going on...the TNC is looking for a CTRL-V between lines
to let it know its not done yet, and to add the next line.

How do I put a CTRL-V in a text file to send to the TNC? I have tried the
obvious, like "^V" and the hex code...but still no luck.

Any ideas?

Thanks much.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I could not agree with you more. Somehow, ARRL got sidetracked by the Internet which represented "digital communications" to the organization. Unfortunately, they didn't notice the "Radio" was missing! HF digital communications is a robust, functional process with ever improving methods. I recently surfed some information on the SCS web page and was surprised at the detailed, high tech discussions for "amateur" consumption. It seems we are rapidly falling behind in our capability to understand and participate in this emerging radio mode.

Thomas, try the AA4RE PBBS program its one of the very best and can
do more than any other I've heard of, like post one text msg to 2 or more
stations (not using the sb all cmd or anything like that).
Ask around its probably in use somewhere in your area.

3731. 9600 on FT2500 and FT8000. Experiences?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-15 00:00:00 UTC
From: willmore@whelk.cig.mot.com
Message-ID: <willmore.837470987@whelk>
Source record: 35777

I'm interested in getting into 9600 baud packet on 2m or 440. I currently have an FT2500 and I am considering getting an FT8000. Has anyone used either of these radios for 9600 baud packet? How well do they work? Is it fairly easy to get them to work--minimum of soldering and modifications to the radio. How quickly do they T/R switch, etc. General recounts of experiences are welcome. Posting here or email to me are equally fine. I'll summarize my findings here for those interested.

Cheers,
David

P.S. Anyone know of an email address for Phil Karn?

>on "unspecified digital codes." Specified codes (including packet) are
>permitted to go as high as 19.6 kilobauds.

No, the specified codes referred to in 97.307(5) are the ones in 97.309(a),
and packet isn't one of them. You can run Baudot or ASCII RTTY at 19.6 kb
on 2m, but for any other data coding you are limited to 20 kHz bandwidth
at an unspecified baud. Packet uses octets, and can contain any arbitrary
data. It is not one of the CCIR telegraphic alphabets listed in 97.309(a).

>Think about it... the manufacturers would not be gleefully advertising
>their "9600 baud ready" radios if they weren't allowed to be used on
>the 2m band! The current problem is our (ham's) own slowness to make
>the transition to higher data rates. You might buy a 9K6 radio and tnc,
>and then find you still have to run it at 1200 baud to have anyone to
>talk to! Bummer...

9600 baud (G3RUH) will fit in 20 kHz. 19.2 kb (FSK) won't.

Hi Christopher,

Well, beacons are considered "bad practice" nowadays, but your question
would equally apply to ctext or ptext greetings, so here's my best shot.

I'm not sure if it will work or not... but you will have to try to put
in a "true" CNTL-V... not a carat sign. This can be done in some text
editors, including DOS EDIT, by holding down the ALT key and hitting
150 (might have to use the numeric keypad instead of the numbers above
the alphabet).

With DOS EDIT, this will show up as a lower case "u" with a small carat sign "^" directly above it. On other editors, it may show up as "^V" but it is a single character, not two. That is... one backspace will wipe it out instead of two.

Another alternative with the paKet tnc program is to enter in one or more CNTL-V's in the keyboard macro area... hold down the CNTL key and hit V, not ^V. This will appear as a small black square. (Be sure to hit ENTER at the end of the line or paKet won't save it!) This is then saved in the paket.cfg file which you can edit into your parameter file under another filename.

Strangely, the Hostmaster program (from Kantronics) will not allow the CNTL-V to be entered in, even from the command line.

Hope it works for you!

73, Stan/KD9BE

Date: 1996-07-16 00:00:00 UTC
From: z008876b@bcfreenet.seflin.lib.fl.us
Message-ID: <4sf2e1$5i3@nntp.seflin.lib.fl.us>
Source record: 35786

Has anyone done any experimenting with APRS? Would like to know where I could get some software for the base here and what tnc's and gps receivers you use in the mobile.

Thanks for any input on this

73,

KA4RTK

Hello ALL

The Winpack home page is getting a good workout and I'm glad some of
you are getting some use out of it !!

I have just uploaded another 5 new winpack servers so check them out.
There is also a new PGP server that can be configured to not sign
message to particular countries and @WW.

Thanks to that NASTY piece of FBB software written by SM6GQW, many PGP
users have had to implement the software, my local Satgate was
concerned at the number of NUISANCE messages that the server was
generating !

Anyway, enough of that, go and check it out, its FREE.....

http://www.healey.com.au/~vk2yx

or if you forget that address, look for vk2yx in lycos or altavista..

Cheers..Peter..vk2yx

>Has anyone done any experimenting with APRS?

Hi Todd.

Sure have! Its becoming quite popular. I have been on since version 2.0, about 3 years ago, and there are thousands of others who are on reguarly in the US.

I think the nation is also coming around to an accepted frequency, and it is 145.790Mhz. It should noted, however, if you are isolated, and the only one on in your area, and cant digi through the next closest APRS station, you wont get any activity...but this situation would probably be preety rare.

>Would like to know where I
>could get some software for the base here

There are lots of spots on the WWW and plenty of FTP sites...I dont have my list here, but I remember this one; FTP//:APRS.RUTGERS.EDU.

Any good search engine will point you to good APRS URLs also.

>and what tnc's and gps
>receivers you use in the mobile.

Just about every TNC will work, but the KPC-3 comes to mind as a good aplication, due to its small footprint, and ability to run on an internal 9vdc battery. Of course...most (if not all) TNCs will run on your cars 12vdc as well.

The GPS that you use is the tricky part. Not all GPSs allow for serial output, which is required for use with a TNC. I have a small list of GPS units that will work with a TNC (APRS), but not with me...if interested, email me and I will send it to you.

>Thanks for any input on this

Sure...and Im sure other will comment too.

Take care Todd.

3745. Litterature about how to build a air-interface for datatransmission?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-16 00:00:00 UTC
From: qpkmima@epk.ericsson.se
Message-ID: <4sg70r$t3l@erinews.ericsson.se>
Source record: 35791

Hello,

my name is Michael Martinsson. I'm currently doing a project for my university (I'm a student). I'm going to build a radiolink for datatransmission. The data are going to be transfered from a mobile plattform in the sea about 500-1000 metres from the University. I think the best frequency for me to use is in the band 432-440 MHz. What I want is some ideas about the construction or some good books or links about this kind of construction. The University wants a proposal for one professional solution and an investigation about how to build it ourselves.

I hope someone can help me

Best Regards

// Michael

This depends on the regulations of each country. Messages to
non-licensed internet users, if sent over the amateur bands, would
definitely be considered third-party communications.

3750. ARRL lawyer to sue member

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-16 00:00:00 UTC
From: "James S. Kaplan" <kg7fu@combined.com>
Message-ID: <01bb739f.8e9f00c0$7f8260ce@surf.rio.com>
Source record: 35796
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

ARRL lawyer to sue member

The following is a copy of a message I received today from
ARRL General Counsel Christopher D. Imlay N3AKD:

To: James S. Kaplan, KG7FU
Copies: Mary Lou Brown, NM7N
Terry Baun
John Poray
Date: July 16, 1996
Re: Your article, SBE Chapter 124 Newsletter, July, 1996
****

Jim, I have just finished reading your article in the July,
1996 Water Cooled Newsletter, page 6. In it, you argue that two of
my clients, the American Radio Relay League, Inc. and the Society
of Broadcast Engineers, Inc. should cooperate in certain government
relations projects, specifically spectrum protection. You note that
I serve as the General Counsel for both organizations. You then
jump from that argument to the following, which I quote:

If Mr. Imlay can't resolve HIS OWN conflicts of interest,
perhaps both ARRL and SBE should be seeking more
effective counsel. No offense Chris, but we have work to
do. We should not only be sending a message to the FCC
and Congress, but to other radio industries.

(emphasis in original)

It is not useful for me to educate you on the subject of your
article to correct the errors in it, and I do not intend to do so.
What I do intend, however, is for you to print a retraction, in
unambiguous terms, in a form acceptable to me, and to furnish to
me, in writing, an assurance that such will be printed in the next
Chapter Newsletter for Chapter 124. Failing that, I am going to sue
you in the District of Columbia for libel.

I have no intention of allowing you to falsely allege that I
have a conflict of interest in representing two of my best clients,
especially in an SBE publication. You are not entitled to damage my
reputation as a lawyer, which you have done in your article, or to
infer (without any basis at all) that I have violated the canons of
ethics governing attorneys, by which I govern my actions.

I will await your response.

Chris Imlay, N3AKD

And here is my reply:

Dear Mr. Imlay:

Thank you for reading my column in the SBE Chapter 124 Newsletter "Water Cooled".

I will not be giving you a retraction for any of my statements published in the July 1996 issue as you have requested. My statements are my personal opinions and views. I do apologize if you feel you have been hurt or damaged by my statements. My intent is to spur thought and action, not to personally attack. If your actions require others to think or act, don't you think they have the right to be informed? I believe my statements to be true and have been given no reason to retract them. My statements, by the way, are my own and don't necessarily reflect the views or opinions of Chapter 124, it's officers or members.

I am a member in good standing of both groups and do many hours of unpaid work for the benefit of both groups and their members. I take personal offense at the threat of lawsuit by their counsel. It is unprofessional and you are certainly coming close to conflict with your fiduciary duty to both groups by proposing to sue a member. Perhaps it is you who owe me, and the Society of Broadcast Engineers and the American Radio Relay League an explanation for your actions and your lack of action in certain critical spectrum protection matters.

After much discussion with SBE and ARRL BOD persons and members I have decided that the best way to deal with this matter is to offer you the chance to refute my statements or rebut, in your own words, in my column for publication in the next issue. In other words, please give yourself the chance to "educate me on the subject of my article to correct the errors in it".

I know you'll also agree that, if you choose to pursue litigation, the proper forum for legal action would be an Oregon court as the column was written and published here.

Sincerely,

James S. Kaplan KG7FU

>I would like to ask whether amplifiers may be used with packet
>radio and, if so, what types/makes are useable.

Hi Rane.

I have found that "voice" amplifiers work fine on AX.25. I have seen quite a
few, and never known one not to work.

>I have a RFC
>Concepts 2-23 30 watt 2-m amplifier, but it has relay transfer,
>which may be too slow for (1200 baud) packet.

Ah...yes. Many times the TXDELAY and AXDELAY need to be adjusted for proper
use. Do you know what the switch speed is on your amp? One thing you should
remember though, the higher you set these parameters, the slower the entire
freq becomes for all the users. Also, those who run CD SOFTWARE ON, will not
"hear" your "dead air", so if your set too high, and begin transmitting,
others will be sure to collide.

>Comments and
>recommendations would be welcome. Thanks!

One last thing...in packet, one SHOULD run a good amount of power if able. This
helps stop the "hidden transmitter" problem.

Take care.

>recommendations would be welcome. Thanks!

Most relay switched amps (and radios too) are plenty fast to
handle 1200 baud packet. Txd is normally 40-50 which is 400
to 500 milliseconds, IE half a second. Most relays switch
lots faster than that. In fact, it is not uncommon to find
a TR relay that switches in 20 milliseconds, and that's
tolerable even at 9600 baud.

I don't know about commercial weather services, but Globe Wireless uses
a proprietary version of Clover that is incompatible with the amateur
version. Check out http://www.globewireless.com.

From: nacec@winternet.com
Message-ID: <4sgovi$kp7@blackice.winternet.com>
Source record: 35805

July 16, 1996

To All Amateur Radio Operators involved or interested in message traffic handling. (Especially those in MARS, NTS, ARES and RACES with message handling experience.)

NACEC, The North American Center For Emergency Communications is looking for volunteers from the Amateur Radio Community. NACEC is a Not-For-Profit Corporation existing to serve the public interest since 1992.

Our volunteers provide an important link between this organization and their communities or military installations, helping with the growth of this organization, the movement of information into and out of their communities, as well as providing a valuable community service. One of the services that a special group of our volunteers provide is message handling for U.S. Military Families Worldwide and the Survivors of Large Scale Disaster throughout North America.

Our all volunteer message handling network now serves several thousand locations across some 6 countries and our hope is to expand this to 10's of thousands of location by the end of this year.

I would like to extend my personal invitation for you to review our organization and consider becoming a NACEC Volunteer. Information and an electronic volunteer application form is available at our Web site, which can be found at:

http://www.nacec.org

Thank Your for your time and consideration.

Sincerely,

Mr. Edward Addy
Executive Director, NACEC
eaddy@nacec.org

Thanks Gilbert for your info. Someone also sent me a schematic
with software for a device that I can build.

Regards.

Like any other volunteer position, the input screen to OO unfortunately does pass some "Kilocycle Kops" who are frustrated by their non-selections for the job of Assistant Hall Monitor.

Far and away the majority of these folks are truly "hams helping hams" in a genuine altruistic fashion.

Since I see little detail here (what article was cited in the notice?) it is difficult to give any meaningful response in this case.

3763. Sitor (amtor) artical

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-16 00:00:00 UTC
From: Tfugate@pop.uky.edu
Message-ID: <4sgr4n$5vp@service3.uky.edu>
Source record: 35809

There was a thread concerning Sitro(amtor) a while back. The August
issue of Popular Communications has a good artical on Sitor. It has
lots of freqs, but I have not had a chance to verify them. Yet.
Please note that I have no relationship with PC other than I bought
this issue. I thought that there might be some interest in the
artical. For those unfamilar with Sitor,the artical also gives
a good technical discription of the 2 modes (Sitor A and Sitor b).
I use a MFJ-1278 to monitor WLO to track the atlantic storms. While
it is not as exciting as grabing an image from one of the NOAA WX
satellites, it is updated every hour or so.

I have another question about APRS, namely, what in the world is it good for? I can understand why one might want to track the location of a car, boat, or aircraft. But in terms of two-way, amateur communication, I have a hard time figuring out where APRS fits in.

Perhaps someone can enlighten me.

Most packet TNC's have variable TXD parameters and can be adjusted up
to over a second. Normally, timing is not critical to packet links.

Thanks Gary - and the several others that responded via mail. I've heard
from hams that have used the RFC 2-23 on 1200 baud packet, and TXD
suggestions. I shall proceed. I very much appreciate the information
that has been volunteered.

3770. Is Pactor2 going to be "the mode"?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-17 00:00:00 UTC
From: gerde@teal.ecn.purdue.edu
Message-ID: <4sj8su$baq@mozo.cc.purdue.edu>
Source record: 35816

Having read QST's July article about digital modes, I am wondering if Pactor2 will be the main mode in digital HF commo. It seems to have the bandwidth and data rate that is wanted by Hams. It is not "owned" by one company so there should be multiple vendors which increases the chances that hams will use it. Any comments?

I would say that automatic selection of phase shift rather than the current manual selection (CSC's version) will make it more usable.

3771. Packet BBS Survey

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-17 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4sjbbp$lom@thepit.trucom.com>
Source record: 35817

Hello, Folks:

Just to keep everyone updated, my Packet Radio BBS Survey is continuing and I have so far received about 300 replies via Internet and around 25 via Packet Radio.

As those who have taken the survey may have gathered, I am considering writting a new Packet Radio BBS program. The ideas that I now have are a bit different from the current batch of PBBS and NOS programs that are available and combine a large number of features found in many current programs, including PBBS, NOS, DX Clusters, APRS, ARES/RACES, and many more.

If I decide to pursue this further, there would actually be at least two programs in the system: the PBBS itself and a "User Terminal" program. The User Terminal would allow full graphical interface and many other special features while at the same time reducing data overhead.

If you have already responded to the Survey, my thanks!

If you have more questions about the Survey or my ideas, please drop me a note either here or on Packet.

If you have not taken the Survey yet, please take a few minutes to do so. It can be found on the Web at:

http://www.trucom.com/ppages/marty

I will also be sending out the survey on Packet again this weekend, so watch for it there with both an @ALLUSA and @WW distribution.

Thanks again!

Take Care & 73

Hi Roger.

Can you give us more information? Are you just asking if it will work, or are you wanting interface instructions? Also, more info on the "model 25"...I believe that is an true 286 IBM computer, with the mono-crome monitor built in to the CPU (if memory serves me correctly :)).

Let us know, and take care.

Actually the model 25 is an 8088 with a builtin color monitor. Have
one sitting in the shack running a packet TNC. Never used KAGOLD on
it, though...

I agree. However, it is the removal of any effective recourse
against the rare (but present) "Kilocycle Kops" that has many concerned.
HR 3207 would effectivly do this. Read the articles I cite in my postings.
Also, I've been told in a private e-mail the HR 3207's real purpose was
to replace one of the lobbying organizations private liability insurance.
(I.E. the Goverment as opposed to private industry would provide the
protection).

No-one has yet to provide any data as why this wasteful, and in my
humble opinion, PORK, is even needed. I've had a number of OO's
write me private e-mail and outline various problems in the
program. However, none of these problems had anything to do with
lawsuits. Lack of FCC support and excessive control by the ARRL
were but two issues cited to me. H.R. 3207 will do nothing to
correct these problems.

It seems to me we should just ask our government to enforce its
own laws instead of coming up with self serving legislation like
HR 3207. Ultimately I think everyone would be better off. And if
me must have a "HR 3207" lets make damn sure we have a way to
drum out the "Kilocycle Kops" from the program.

This legislation is flawed. Please write your congressman and
let him know if you don't agree with it (or want it ammended).

>
> Since I see little detail here (what article was cited in the notice?)

>Rolfe
>W3VH

Rolfe.

APRS is a clever program that takes advantage of a TNCs UNPROTO and
BEACON command. In conjunction with either user enetered, or GPS generated,
LAT and LON coordinates, it can mark (or track) objects on its built in map(s).

A couple of uses that come to mind, would be for say, a marathon race or the
like. You could outfit the lead vehicle, and the chase vehicle (or persons)
with a GPS/TNC/HT setup, and the progress (group of runners) of the race could
be tracked through the race on one frequency automatically from a "command
post", without the cumbersome use of voice communications.

Another would be certain rescue operations. The "command post" could track and
follow a group of rescuers, in say a wooded area, and be able to effectively
coordinate the effort to cover the entire area, while keeping rescuers apart,
and aviod wastefull "back-tracking" of already searched areas.

APRS is relatively new, and is considered to be experimental...which is an
obvious reason for continued development, and considered one of the "back
bone" aspects of amatuer radio...which is an area that I think all hams will
agree should continue.

Hope this helps with your query Rolfe.

Take care.

Public Service events find it very useful, but if your tracking something that goes a long way, they networking (off sorts) is still required.

APRS has also been used to identify "beacons" (individual stations) on a map(s). I have also heard it used to track weather reports, shelter counts, and other misc stuff. Down load the software - it has a Verrry large list of poteial and actual usages...

>should be multiple vendors which increases the chances that
>hams will use it. Any comments?

I don't think Pactor-II will be adopted widely by HAMs as long as it's
manufacturer SCS does not openly disclose its modulation and protocols
(see also what happens to Clover and GTOR - compared to the broad base of
SITOR/AMTOR which are public ITU recommendations).
So it is no basis for experimentation, further development or development
of compatible lower-cost implementations (without paying SCS a hefty
licensing fee, probably).

I'm looking to develop a Lab that I can use to teach communication principles, (preferably FM/FSK) It's important that parts be readily available (ie. no expensive/special crystals) and it should have the ability to tx/rx about 50 feet simplicity is also a concern.

While I have some Ideas of my own .. I'm interested to see what other people have used or know about, maybe you know a chip manufacture that has just come out with just such a thing on a single chip?

if you can indicate complete system cost, it's helpful.

thanks

Seat of the pants I use (K)*SQR*H, where K (K-factor) is 1.33
and H is in feet.

I answered a similar question on the TAPR Spread Spectrum
mailing list a bit ago also. Here it is:

At 06:51 PM 7/10/96 -0500, Rick W0TN wrote:
>Jeff,
>
>What link analysis program do you use?
>
>73/Rick W0TN

The topo 'program' I use is a excel spread sheet I got off of
http://www.gate.net/~dlung/indexftp.html . Its got versions
for lotus also. I've used various link analysis programs but
around here (Michigan) its often hard to get a line of site
path. With the graph function of EXCEL, I can get a good
idea of the fresnel zones and I can play "what if's" with
antenna heights. Note, you do need a topographical map to
enter the data. I understand there are CD-ROM databases
with all the topographical data already in them but I
believe they are expensive ($2000+ ??).

3795. Re: Is Pactor2 going to be "the mode"?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-18 00:00:00 UTC
From: Phil Karn <karn@unix.ka9q.ampr.org>
Message-ID: <31EE0A66.FF6D5DF@unix.ka9q.ampr.org>
Source record: 35841

Personally, I don't consider Pactor, AMTOR, G-TOR *or* Clover to be "it". I think it is still possible to do much better in the design of a digital HF protocol.

That it is possible to do better can be seen in an earlier article in QEX that compared Clover to a NATO standard HF modem. The NATO modem required about 10 dB less Eb/N0 than Clover, i.e., 10 dB less RF power to maintain the same data rate.

The problem is not that Clover (or Pactor or AMTOR or G-TOR) are incompetently designed. The problem is the artificially narrow channel bandwidth in which all these amateur modems must operate. The NATO modem operated in a 3KHz bandwidth. And it is fundamental physics that one cannot have both low power and low bandwidth at the same time.

I have been sketching out ideas for a coded M-ary FSK modem that I firmly believe will outperform, in power, all of these narrowband modems. I will, of course, need an STA to try them out on the HF bands. Once I have demonstrated that they work, the next step will be to convince the amateur population to support a rule change to relax bandwidth limits in order to obtain the benefits of lower power levels.

The technical part is easy; the theory is well understood, and non amateur groups have used these techniques for years (in particular, the Brits built their 32-ary FSK modem "Piccolo" in the early 1960s). Based on the utterly irrational reaction expressed to the recent spread spectrum rule changes it is clear that the biggest challenge by far is getting the rules changed to reflect the technical reality that controlling power is more important than controlling bandwidth.

>the PK-12 with WinPack and Windows 95 I would appreciate the parameters,
>etc. Thanks.

The rough get "you going" for AEA TNCs goes something like this:-

1. Make sure the PK-12 is out of host mode. If you've been using it with
Pakratt it could well be left in host mode when you exit from that
program.

2. Read the "TNC Settings" section of the help and try to implement what
it says. Note that some of the AEA params may have different names from
the TNC2 clone names used in the help. However, param sets for PK-88,
PK-232 and PK-96 are supplied with WinPack.

3. Select "Options", "Comms Setup" in WinPack, press <F1>, when the
picture appears click on the various input boxes and read the pop-up
helps - particularly the one on "DCD shows conn".

>
>Most packet TNC's have variable TXD parameters and can be adjusted up
>to over a second. Normally, timing is not critical to packet links.

Alas, it isn't quite that simple. In a WAN environment, the slowest
switching radio determines the Txd that *every* radio in the WAN has
to use. Otherwise, other stations can't work him successfully, and
he can inadvertently become the mother of all hidden terminals for
everyone else's communications. So timing *is* critical.

There is an advantage to having all the radios in a system capable
of a rapid TR turnaround. The flag transmission during Txd carries no
intelligence, it just allows the slowest radio to synchronize. So
if all the radios can handle a short Txd, more channel time is available
for intelligence to be transmitted. At 1200 baud, and with typical
frame sizes, a Txd of 40-50 is tolerable since it is only a small
percent of total transmit time. At 9600 baud, a much shorter Txd
is desired (8x shorter to keep the same percentage ratio).

But the relay is usually not the slowest part of the TR turnaround.
Usually, the slowest thing is receiver recovery. So as long as the
relay switching time is less than the receiver recovery time, there
is no penalty paid for using relay switching. (That assumes auxillary
contacts on the TR relay aren't also what activates the receiver.
In that case, the two times cascade, and performance is directly
penalized.) The receiver has to recover before the TNC clock can
synchronize, so those two times always cascade. Receiver recovery
time is almost always much longer than TNC clock lock, however,
so it tends to dominate.

There are several factors which control receiver recovery time.
For PLL radios, PLL lock time is often important. But the major
thing is usually the charging time of the B+ decoupling capacitors
in the receiver.

Basically, it doesn't. APRS has a mode where you can exchange short
messages with other stations, but its primary purpose is for tracking
telemetry. That can be very useful, for tracking a balloon launch
for example, or for keeping track of comm assets during an emergency,
or simply for monitoring what propagation paths are available at
a given moment.

Not everything amateur has to be realtime two way communications.

What are the consequences of promoting relatively wide band digital modes, e.g., on band occupancy and throughput. What gets optimized? Are there tradeoffs in quality (throughput per session) vs. quantity (number of simultaneous sessions supported)?

In short, why will amateur radio be better with wide vs. narrow digital modes? I think making the case for relatively wide bandwidth approaches will be easier if the answers to these questions at the operational level are widely understood.

Why would anyone want to access the internet via ham radio? The other
way... maybe. Unless you are interested in radio, just stay on
the internet. You'll be happier.

But there are plenty of reasons to become a ham radio operator.
Applying digital techniques to radio is just plain interesting.
No it ain't fast, but the reason isn't that ham radio is
backward technologically. There are challenges and obstacles to
overcome. That's what makes it fun. There's more to life than
firepower.

>What are the consequences of promoting relatively wide band digital modes,
>e.g., on band occupancy and throughput. What gets optimized? Are there
>tradeoffs in quality (throughput per session) vs. quantity (number of
>simultaneous sessions supported)?

Good questions. I've been trying to answer them in the context of the
spread spectrum rules debate, but I think it needs to be a much wider
discussion. See my reply comments to the FCC on this issue:
http://www.qualcomm.com/people/pkarn/papers/mysscomments.html.

The bottom line, in my opinion, is overall spectral efficiency. That
is, we should promote modulation methods that maximize the total
number of bits that can be carried by all the users sharing a given
chunk of spectrum. That is, we should strive to make the overall pie
as large as possible, because that has a much larger effect on the
per-user throughput than anything else. The key to spectral efficiency
is being able to physically pack users on the same band as densely as
possible without mutual interference.

It is highly counterintuitive but nonetheless true that this is best
done with *wideband* (i.e., spread spectrum, or spread-spectrum-like)
modulation and coding schemes. And high interference resistance is
possible only with wideband (i.e., spread) techniques. And it turns
out that the benefits of the added interference resistance outweigh
the extra bandwidth.

3805. Digital Microwave Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-19 00:00:00 UTC
From: nickkral@america.CS.Berkeley.EDU
Message-ID: <4smur8$8r4@agate.berkeley.edu>
Source record: 35701
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I have the unique fortune of living about 1000 ft (0.2 miles, or 330 meter) away from an internet service provider. I've been working with this provider for quite some time, and I want to setup a full time link to them. I am hoping that this will be a high speed link (1/2 T1 speed). Laying actual wire is out of the question, because it crosses heavily used roads.

I read on rec.radio.amateur.digital.misc that a microwave transmitter and receiver combo would be the ideal solution to this problem. In addition to being low cost, it also gives the necessary range and high speed performance for what I need (this is what I read...).

I'm guessing that I have to design my own setup for this type of thing. Actually, I would prefer to do my own construction of this microwave transmitter, since it would give me good experience dealing with microwave circuits (I'm a recent graduate of UC Berkeley with a bachleors degree in Electrical Engineering and Computer Science).

I've been doing a lot of internet research, in addition to going to book stores and libraries to find a design for this type of thing. Unfortunately, I can't find any design online or in books.

Does anyone know of a design for a digital microwave transmitter/receiver combo that is available on the internet or in book form? Or perhaps I'm going about this in the wrong direction...

Once I got the hardware in place, I could handle the IP routing myself. (I'm great with software, but not quite as good with hardware).

Any suggestions would be appreciated.

Take care,
-- Nick Kralevich

>then... Ciao!
Don't worry from that standpoint (in so far as I am concerned). I am a
former 11 meter op who got out of that bad news almost 4 years ago. I
know the feeling when it comes to CB. Too many "bucket mouths" and not
enough common sense. The most unfortunate point of all this is that
the nitwits are generally the most vocal.

Go to the nearest ham radio store and buy a copy of the ARRL Handbook
for Radio Amateurs and then read up on the 10Ghz Gunnplexor/2MBPS
project....

You can also get a jumpstart by checking out the various links from my
web pages on high speed packet....
http://www.mindspring.com/~bobm

several people, especially Barry VE3JF, have put together alot of
info on the subject... Glenn N6GN has built 230kbps digital
radios... check out the link to his info too.... lets see... Oh the
guys over in Utah have put together a T1 system, do a search to find
more info on it... also you might want to check out "off the shelf"
solutions with things like the WaveLan cards....

Realistically, using the new WA4DSY 56k RF modems may be what you
need....

You would probably be better off buying one of the license free FCC part
15 data radio systems on the market. These operate in the 900 and 2.4GHz
bands. For the short range you are talking about, you would probably not
have any interference issues to worry about. This would free you of the
difficult task of building your own RF hardware, which is not trivial,
and the problems of dealing with the limmitations of data format and

content operating the system under Amateur Part 97 rules (assuming you were interested in operating legally).

Good Luck

Steve Muther WF6R

3812. Ringo vs Quad for Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-19 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4soj5o$2ac@thepit.trucom.com>
Source record: 35708

Hello, Folks:

I have a question about a strange problem (?) I am having with a 2m packet link that seems to be antenna related...

Set Up #1 is as follows:

RIG : Kenwood TM 2550A with 50 watts RF out
ANT : Ringo Ranger II at 40 feet
FEEDER : 60 feet 9913

Set Up #2 is as follows:

RIG : Kenwood TM 2550A with 50 watts RF out (same rig as above)
ANT : Home Brew 6 element quad at 50 feet
FEEDER : 60 feet 9913 (different run)

The other station's set up does not change.

Now, the wierd part...

When using the Ringo, there is no detectable change at the other station in my signal when I switch between Voice and Packet modes as measured on the receiver.

When I switch to the Quad, however, my received signal strength on Packet is just a hair over one half of the signal when on voice. In fact, the Quad's packet signal is LESS than the Ringo's packet signal while the Quad's voice signal is much stronger than the Ringo's!

Any ideas?

3813. KAWIN NEWS - Introducing KaWin Lite!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-19 00:00:00 UTC
From: stan@mutadv.com
Message-ID: <4sofpl$1kc@news-2.csn.net>
Source record: 35709
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.equipment

KAWIN NEWS - Introducing KaWin Lite!

KaWin 6.40 is ready for download! Corresponding changes to the help file too. KaWin 6.40's enhancements are directed toward Kpc-3 owners.

The Kpc-3 is a great little TNC for VHF packet with all the benefits of Kantronics Host Mode and more, but it offers neither simultaneous multi-port port operation, nor HF digital modes. Thus, Kpc-3 users only have access to the tip of the KaWin iceberg!

For these users, there is now KaWin Lite registration!

KaWin Lite registration is a special opportunity for owners of the Kantronics Kpc-3 or other Kantronics single port TNCs. With KaWin Lite registration you enjoy all the features and benefits of the full KaWin program, with a very simple limitation:

KaWin Lite registration is ONLY valid when used with one, single-port, Kantronics TNC - such as a Kpc-3. KaWin Lite registration fee is just US$39.

KaWin Lite is NOT a separate program. KaWin Lite registered users use exactly the same KaWin (version 6.40) program, but the KaWin Lite registration will turn off that ugly nag meter just like the full registration as long as these simple conditions are met:

1) Only one TNC is defined in Option/TNCs&Radios,

2) That TNC is the first TNC in the list (TNC 1), and

3) That TNC is configured as type, "All single port".

If you comply with those three simple rules you can enjoy the benefits of KaWin registration at a bargain price. But remember, whenever any of those three conditions are NOT met, KaWin will behave as an unregistered program.

Registered users with KaWin Lite registration who upgrade their systems to a Kam or other dual-port TNC, or who add additional TNCs may upgrade their KaWin Lite registration at any time through a KaWin Upgrade registration.

To add to the KaWin News mailing list, send email to
stan@mutadv.com with the word SUBSCRIBE in the subject line,
or use the handy subscription link on the KaWin Home Page.
To be removed from the list, send email to stan@mutadv.com
with the word UNSUBSCRIBE in the subject line and be sure to
include the email address this message was sent to in the
body. I cannot remove you if I don't know your address!

3814. Pac-Comm Spirit-2 problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-19 00:00:00 UTC
From: Rob Dover <robd@netshop.net>
Message-ID: <31EFEAA5.349@netshop.net>
Source record: 35710

Greetings.
I am hoping someone here can assist with a Spirit problem I have run into. I recently purchased 2 PacComm Spirit-s backbone tnc's and am trying to get them to run with TheNET X1J4 firmware. The problem is that both TNC's randomly and intermittantly scramble the callsign and require nuking the RAM to get them back to normal. Both TNC's exhibit exactly the same problem. The only way I can get them to run reliably is to cripple them by removing the 20 MHz GAL and running them at 10 MHz.
I have burned the firmware into the PacComm supplied 70nS EPROMS so that shouldn't be a factor. Or should it? The PacComm docs say a 20MHz Spirit needs a 55 nS EPROM but PacComm tech support says 70 is OK.
I have checked, rechecked, and triple checked the jumpers and they all seem fine. The TNC's work fine at 10 MHz but not at 20.
If anyone here has seen this problem or has any ideas, I would appreciate a response.

Thanks and 73 -Rob-

>However, why worry about amateur compliance anyway?
>The 900mhz band is now available for public data communications use,
>and would probably work for Nick's application.

Actually, I was worried about compilence with existing laws. I didn't
want to break any amateur packet laws, or have the FCC come knocking
down my door due to an illegal transmitter. :) I also don't want
to have to sensor everything that crosses the wire. As you and others
have pointed out, that pretty much eliminates me from the amateur band.

I have no intention of running an illegal setup, nor corrupting the
amateur bands.

I just asked in these newsgroup because, well, you don't find
many newsgroups on the internet called
alt.how.do.i.build.a.microwave.transmitter.for.t1.speed. :)
I'll be sticking to the legal to use bands.

Take care,

From: hbcsc274@csun.edu
Message-ID: <4sp693$595@dewey.csun.edu>
Source record: 35712

Greetings,
I am trying to wire a cable for my BP-2 that is coming next week.
According to the Baycom help file, it says the following

YAESU - PTT is normally activated by grounding the mic input thru a
resistor. The internal resistor in the BP-1 should work just fine.

Wires: Red - No Connection
Yel - Tip of mic plug
Grn - Tip of speaker plug
Blk - Body of speaker plug
Shunt: Install shunt on BP-1 to use internal resistor

Well, now I have several phone cords that have different color schemes.

Here's a picture from the bottom:

```
____
||||||
| | <-- clip is underneath
|____|
||
||
||
||
```

Reading it left to right, one is yellow, green, red, black.
Another one is black, red, green, yellow.
It appears that some of these phone cords are reversed. Which way is correct?
For now I did it the way of majority rules, which is most of the phone
cords I have are this way: yellow, green, red, black. I hope this is
right because I hate to take it apart and resolder it all.

HELP!

There also may be some liability in publicly posting a private legal communication, I don't know. But I do know that spraying the net (8 newsgroups?) with your private gripe is kind of obnoxious and seems intended to intimidate your "opponent". If you wanted opinions from the group(s) about the original complaint, you should have discussed it with us legitimately. You may be a bit casual with your use of mass communication, and you may have also added to your difficulties by posting this way.

It is unfortunate that your initial exposure to Hams has been negative.
The fact is that you are dealing with people and some aren't so nice. I
was first licensed in 1952. It seems to me that Hams at that time were
more helpful, courteous and well mannered. Yes, there were isolated cases
of jerks on the air then. I have noticed, however, that the number of
jerks on the air have increased over the years. There is always the
option that you don't have to associate with them. There are plenty of
Hams with white hats left. Ham radio has several areas of interest other
than just communicating on the radio. My primary interest in the hobby
was and still is designing and building equipment. I do very little
operating. You need to sort out what area of the hobby interests you and
consider if it offers enough to put up with a few bad apples.

Hello Marty, I assume you are using different frequencies for packet
and voice transmissions, and that the two aerials (antennae) are
located a few feet apart.

If this is the case I think the aerials may be in a different
position relative to the standing wave patterns of the transmitted
signal, one may be in a peak, and the other in a null. When you
change frequency, as from voice to packet, the wavelength of the
standing wave changes slightly, and this can move the RX aerial from
a null to a peak in the signal.

Of course, I am possibly wrong.

Cheers,,,,,Jack.

I'll agree with you here. I used AA4RE on my packet BBS for some time
& loved the way it grabbed AMSAT & ARRL dupes before they got anywhere
further in the network. However, I changed to F6FBB purely for network
compatibility.

However, I still miss AA4RE as it is a good robust BBS program. You
will need to be able to run your TNC's in host mode to be successful.
If you are using an AEA TNC (I was using PK-88's), it's best to blow a
special host mode EPROM for them as AEA's host mode isn't mucj chop
compared to the orignal (written by WA8DED).

1996 ARRL and TAPR Digital Communications Conference
September 20-22, 1996
Seattle, Washington (minutes from SeaTac airport)

Web: http://www.tapr.org

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 15th Annual ARRL and TAPR Digital Communications Conference. This year marks the first year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting have joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-orientated amateurs of all levels of experience.

The 1996 ARRL and TAPR Digital Communications Conference will be held on September 20-22, 1996 in Seattle, Washington. This year's conference location is just minutes away from the SeaTac (Seattle/Tacoma) Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the frequency allocations we now have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner as well

The conference is not just for the digital expert. This year's conference will again provide an entire morning with beginning and intermediate presentations on selected topics in digital communications. Some of the

topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

Workshops

In addition to the presentation of papers on Friday and Saturday, three workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh and more recent co-developer of the Windows95 version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WA8DZP , will conduct a workshop focusing on "How to utilize Part 15 wireless Radios for Ham Applications." Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet connectivity. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service. A second Sunday workshop will focus on Wireless Networking using the WA4DSY 56K RF modem Technology. This workshop will focus on the technology and accessories of creating and maintaining 56K networks using the WA4DSY modem and equipment compatible with it such as routers, digital driver cards, transverters, and repeaters. Use of WA4DSY 56K equipment in the 219-220 band will also be discussed.

1st Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full time students to compete for the first annual student papers award. Two $500 travel awards will be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see guidelines for more information). Papers coauthored by educators or telecommunications professionals are also eligible for this award, as long as a student is the first author. First year awards have been funded through a grant by The ARRL Foundation, Inc. Deadline for receipt of finished student paper manuscript: June 11, 1996. Please note that this deadline is different than the general conference submission date. For full details and paper guidelines contact TAPR or check http://www.tapr.org.

Call for Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 23, 1996, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to lweinberg@arrl.org. Information on paper submission guidelines are available on-line (http://www.tapr.org).

Local Co-Hosts

The 1996 ARRL and TAPR Digital Communications Conference is co-hosted by the Puget Sound Amateur Radio TCP/IP Group and Boeing Employees Amateur Radio Society (BEARS).

The Puget Sound Amateur Radio TCP/IP group is an informal group involved in an ongoing project to build and expand an amateur radio digital network in the greater Puget Sound area of the Pacific Northwest US. The Washington Experimenters TCP/IP Network (WETNET) uses TCP/IP as its primary transport protocol and currently has over 250 users. WETNET is linked to other amateur radio TCP/IP networks via the Internet. The Boeing Employees Amateur Radio Society (BEARS) is a general interest amateur radio club for employees of the Boeing Company, headquartered in Seattle, Washington. The BEARS are an active amateur club, supporting radio classes, VHF/UHF repeaters, and digital communications. BEARS has been instrumental in the construction of the Evergreen Intertie, an extensive network of interconnected repeaters in the Pacific Northwest.

What can you expect during the 1996 ARRL and TAPR Digital Communications Conference ?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Three workshops
Friday (4pm) - APRS, Conducted by Keith Sproul, WU2Z
Sunday (8am) - How to utilize Part 15 Radios for Ham Applications, Conducted by Dewayne Hendricks, WA8DZP
Sunday (noon) - Wireless Networking using the WA4DSY 56K RF modem Technology

* The first annual Student paper session.

* A banquet with Special Guest Speaker Lyle Johnson, WA7GXD
Lyle was one of the founders of TAPR and instrumental in forming many of the current aspects of Amateur Digital Communications. He is currently very active in building several digital aspects of the upcoming Phase 3D satellite.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Vendor area and informal engineering discussions/demonstrations.

* An event at which the most important new developments in amateur digital communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

* Plenty of Washington State hospitality!

Conclusion

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours! If you have never been, then make your plans now to attend and find out how much fun the Digital Communications Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference on September 20-22!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: tapr@tapr.org Web: www.tapr.org

Sincerely,
Steve Ford, WB8IMY, ARRL Conference Co-Chair
Keith Justice, KF7TP, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Local Host Liaison
Greg Jones, WD5IVD, President TAPR

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and workshops will be held at the Quality Inn Seattle Airport, a complex co-located with the Radisson Hotel Seattle Airport. Rooms rates are $66/single-double and $76/triple. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. It is highly recommended that you book your room prior to arriving - a block of 75 rooms is reserved until September 6th, 1996. After the 75 rooms are booked, rooms will only be available in the Radisson hotel, but will be at a higher price. Be sure to book your rooms early! The hotel provides transportation to and from SeaTac

Airport. You should contact the hotel to arrange airport transportation.

Quality Inn Seattle Airport (conference hotel)

This won't work on amateur frequencies, as the transmissions comming
from the internet would most likely contain material from non-amateurs
and could also be made up of content unsuitable for transmission on
the amateur bands.

Well clearly it isn't any use for what we do now, we have to find something
to do with it. If we do find something for it to do,m then we risk it becoming
essential :-)

A club I was in used to do the coms for a 100 mile horse race
in the mountains west of Washington DC. Hams were at each check point
using packet to relay the times that horses clocked in. THis
way we could tell if any horses were overdue. It would have been very nice
if the location of each station could have been updated automaticallyback k
at the nerve center of the horse race, as each station/check point opned
and closed.

Bob WB4APR is using APRS for meteor scatter. You point your
antenna to the radiant for the meteor shower and turn on your APRS machine.
After w while you've found all the people in range for the meteor shower.

Ham's doing emergency communications can be tracked automatically.

Bob is working ona scheme where your regular voice modulated box sends
an APRS burst at the end of every transmission. That way you know
where the other guy is all the time (you can point your beam and fill out
the QSL card, in the time normall taken to hunt for him with the
roator control).

Hello Rolfe, Have a look at WEB PAGE:-

http://ourworld.compuserve.com/homepages.mike_j_tyrrell/centralc.htm

There is a good description with pictures and diagrams of APRS and
GPS used by The Radio Amateur Emergency Network in England.

Cheers,,,,Jack.

I have looked at a lot of different systems and there are a few out
there for the Mac, but none are as "polished" as those for the PC.

Your best bet may be to look for a NOS variant.

>recommendations would be welcome. Thanks!

Contrary to widely spread belief, it is not the relay that makes
amplifiers slow. It is the RF-VOX circuitry that drives the relay.
This can be especially bad when the amplifier is designed for SSB.

When it is only for FM, or you want to use it only for that, check
the circuitry to see if you can make it faster. Or, drive the relay
independently of the RF input by switching it directly from the PTT
signal of the TNC.
(watchout for unwanted currents between amp and trx, e.g. when there
is 5V on the PTT pin of the trx during receive, and the relay is 12V.
Use a driving transistor)

>Most packet TNC's have variable TXD parameters and can be adjusted up
>to over a second. Normally, timing is not critical to packet links.

While this may be true for the individual that uses the slow transmitter
(and long TXDELAY), it *certainly* is *not* true for the the community
using the channel.

Stations with long TXDELAY use more-than-reasonable amounts of channel
time, thus increasing the load on the channel. Furthermore, when their
long TXDELAY is really required to accomodate a slow transmitter, they
have a long "dead time" between receive and transmit, and thereby
cause a large number of collisions.

For efficient packet transmission, you need a fast transmitter.
Also, you should tune the TXDELAY to the value really required, not
the 360ms default that many TNCs are set to.
Modern PLL FM transceivers (slow...) should work fine with 150-200 ms
of TXDELAY with 1200 bps.

As long as one could reasonably ensure the transmissions were compliant,
there should not be a problem. For example e-mail forwarding should
be OK(3rd party traffic, right?), but reading alt.sex.xxx newsgroups
containing profanity or business spams probably shouldn't be OK.

The only REAL Part 15 argument that could work against your link, would
be that it would be BYPASSING a viable commercial means of communications;
the telephone. However, if you kept a web page that was up 24hrs/day,
you can argue that it is not reasonable to keep a telephone link
operational 24hrs/day, and so you would not be bypassing a commercial
system.

However, why worry about amateur compliance anyway?
The 900mhz band is now available for public data communications use,
and would probably work for Nick's application.

<4smur8$8r4@agate.berkeley.edu>...
: I have the unique fortune of living about 1000 ft (0.2 miles, or 330
: meter) away from an internet service provider. I've been working with
: this provider for quite some time, and I want to setup a full time
: link to them. I am hoping that this will be a high speed link
: (1/2 T1 speed). Laying actual wire is out of the question, because it
: crosses heavily used roads.
:
: I read on rec.radio.amateur.digital.misc that a microwave transmitter
: and receiver combo would be the ideal solution to this problem.
: In addition to being low cost, it also gives the necessary range and
: high speed performance for what I need (this is what I read...).
:
: I'm guessing that I have to design my own setup for this type
: of thing. Actually, I would prefer to do my own construction of
: this microwave transmitter, since it would give me good experience
: dealing with microwave circuits (I'm a recent graduate of UC Berkeley
: with a bachleors degree in Electrical Engineering and Computer Science).
:
: I've been doing a lot of internet research, in addition to going
: to book stores and libraries to find a design for this type of thing.
: Unfortunately, I can't find any design online or in books.
:
: Does anyone know of a design for a digital microwave
transmitter/receiver
: combo that is available on the internet or in book form? Or
: perhaps I'm going about this in the wrong direction...
:
: Once I got the hardware in place, I could handle the IP routing
: myself. (I'm great with software, but not quite as good with hardware).
:
: Any suggestions would be appreciated.

As my boss always says "why re-invent the wheel?" Western Multiplex makes
a little SS unit for 2GHz called the Lynx. These are showing up on the
surplus market because for high reliablilty/quality most cell techs don't
like them (a matter of personal taste). I would think that picking up a
used pair of these would be cheaper and easier than building something
unless you're looking for the experience. These units don't require a
license for operation as they are covered under part 15. I've put up 40
mile hops with them (using 8 foot high performance dishes) so I would
think that a pair of homebrew yagi's would get the job done for you.
```

I was hoping to avoid "off the shelf" solutions due to their high cost.
Besides, it would be interesting to experiment with building equipment
like this.

>Realistically, using the new WA4DSY 56k RF modems may be what you

Hey all...

I'm just wondering if anyone out there has done any packet work with a Newton PDA. I know I could just use it as a terminal, but I was kinda hoping that someone might have written something for it to use an FSK modem... cheap and low power.

Thanks!
Jeff

If you are operating under Part 15, you neither have to worry about bypassing
the telepone circuits or content. There is no FCC/PUC ruling regarding this,
if there were, a lot of wireless service providers (in licensed and
unlicensed spectrum) would be out of business.

Wavelans cards are not that expensive and may do just the trick for
you. TAPR just placed a group order for the cards with somebody and
they had the price down to ~$200 per card...

>Oh, one more question. Do you have any idea how much this type of
>project would cost?
welll a PC on each end (if you dont have them already) ~$2000 or
less... 2 wavelan cards for $400 A good pair of yagi's for 900
Mhz... $300 unless you make them yourself! and good quality
hardline and some bnc adapters....?

So figure ~$3000 total... $1500 per node is about right

If you work through the Shannon equation, you can show that the
improvement gotten by expanded bandwidth compared to a narrowband
CNR improvement is a cube/square relation. The wider you spread,
the greater the relative improvement factor.

Jim, you wrote and published that Chris Imlay was providing less than
fully effective legal service to two of his clients on account of
conflict of interest. And you have repeated that allegation to the
Usenet world at large.

I believe that a defense of personal opinion is not available to you
in this matter. I believe that you will need sufficient proof for
your repeated allegations of professional malpractice to have Chris
at least sanctioned if not disbarred, or your defense will fail.

> I know you'll also agree that, if you choose to pursue litigation, the

Hello Bill,
Your prayers are answered the program does exist it is called Jnos.
This runs under dos and allows a a full time slip connection to exist on
one port and tncs on other ports. This is the program that most tcp/ip
users are running.
For help getting it up and running contact your local IP coordinator
and chat with him. If you need more advanced help down the road shot me
some mail and I can put you in contact with the gentleman in our area
that is running this configuration.

Hello, Gary:

Maybe I wasn't clear... I have different signal strengths (on the same freq with the same radio) between Voice and Packet with the same Quad antenna. It is vertically polarized.

I'd like to see your analysis.

The SS capacity analysis actually involves more than the Shannon equation. It depends also on propagation factors. Free space propagation is inverse square, but much terrestrial propagation is inverse r^4 or even higher. This is what makes cellular telephony (especially CDMA) work.

A little thought will show that geographical frequency reuse won't scale arbitrarily with an inverse-square propagation law. It's related to Olber's
Paradox: "Why is the sky dark at night?" Just how is left as an exercise for the reader...

Granted, it wasn't the pinnacle of humor, but whining about how much YOU pay for internet service isn't particularly newsworthy either. Here in Seattle, Eskimo North offers a PPP connection with unlimited time on-line for $6 bucks a month if you pay in advance. Check around in your area. I can't believe people are actually paying to download email. Sheesh.

Wait a second ...

If a fellow is working for two sides of an issue at the same time there
has to be no proof of conflict. You can not prosecute and defend. There
needs to be no proof.

I can't hire an FCC lawyer to represent me should I be accused of
a Part 97 rule violation. The FCC would see that, without proof, as
a conflict of interest.

Now, is the ARRL seeing their lawyer as being in a conflict of interest?
We've not heard from them. Maybe we should wait for their thoughts.
I hope they comment as I don't want to make my judgement based on
what has been presented here (and with the implications a lack of
comment would have).

Expressing an opinion that someone in a membership organization is
out of line is part of the democracy of the organization ... right?
The legal threats which resulted were sad. I would have defended
myself in a reply. Let's hope he was just too upset to see an
alternative course. If not, he's doing a pretty poopy job (I'm a
member! I'm a member!).

Hello there....

I'm installing Winpack 5.40 and in the Options section, there are two areas in the Persoanl/BBS info that don't make sense to me.

One is WAB - what is WAB and how do you figure it out? Is this something like the Maidenhead locator?

Second, what are they looking for with QRA?

This may seem elementary to some of you, but I'm stumped.

Thanks, Bob, VE7HS

>Jeff Cook

I am only a gonnabe lawyer, so I'm not going to express any legal opinions
regarding this dispute. However, I am going to say that I don't care much
for a scenario where a lawyer threatens litigation against someone who airs
an opinion that the lawyer is acting improperly. The First Amendment was
written precisely to permit ordinary citizens to criticize powerful members of
society without fearing legal retribution. When an attorney seeks to exploit
his stronger position vis'a'vis his ability to litigate, in order to suppress
free speech, this is not good.

In fact, I suspect (this is not a legal opinion, just a guess) that a court would
make short work of any libel case connected with this matter.

As far as the use of the internet goes, I kind of think that the internet
strengthens free speech, by giving those without ordinary media access
a public forum in which to express opinions. Nothing wrong with that, in
my opinion.

>rtty. THanks for input Lynn
>--

For RTTY non-contesting use, I've tried 'em all and I always end up back with Hostmaster II+, the Kantronics factory item. It's a DOS program, so it's faster than any Windows program and it works flawlessly. It allows simultaneous monitoring of HF, VHF connected packets and VHF unconnected packets. No switching windows - all three are on the screen at the same time.

For RTTY contesting, get RTTY by WF1B. It has become the de facto standard and the author, Ray Ortgiesen, supports it very well. He is always adding new contests and features. Thanks to Ray's program, RTTY contesting has become my favorite mode. The way you can use a mouse or keystroke to "capture" calls off the screen is really slick. I love to show it off to someone for the first time and watch their reaction.

In all fairness to some of the Windows programs, they do offer lots of bells and whistles which some folks may find useful. Download their demos and try them out, but I think you'll find a lot of the gee-whiz stuff just slows things down without adding much value.

From: marty@trucom.com
Message-ID: <4suaif$alo@thepit.trucom.com>
Source record: 35613

Hello, Folks:

Anyone out there have any experience with the PC Flex software,
particularly the Sound Blaster sound card drivers?

I would be especially interested in how the 9600bps SB driver works
for you.

I am interested in doing some serious development of the local packet
network and I can get PCs and SB cards for a LOT less than I can get
TNCs (I have more than a dozen 386/486 PCs and a whole box full of
SB-16 cards!)

I noticed that the SB driver strongly suggests that a 486 be used.
Anyone tried it on a fast 386 (66Mhz+)?

Thanks!

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple carrier operated relay. You still need to provide a duplexer, antenna, & ID'er w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

>
>HELP!
>Jerry KE6UUX

Jerry, ordinary phone cords are not wired "one to one". Each end is
the mirror image of the other. So one end of the cord will be yellow,
green, red, black while the other end will be black, red, green,
yellow. (Hey, I didn't invent the convention, go ask Western Electric
why they did it this way.) So it depends on which end of the cord
you are looking at as to which color scheme is correct.

More to the point here, you aren't hooking up a phone, so it doesn't
matter what colors you use. Just make sure PTT goes to PTT, audio

out goes to audio in, etc. Ring it out with an ohmmeter if you have to.

Not necessarily, it must depend on how many sides there are. The
question is not whether Chris is working for two sides of an issue
but whether it is for two *opposing* sides. Is there an issue for
which he represents two parties where the advancement of one of his
clients' will come from a disadvantage to the other? If so, then
this would be a conflict. What is that issue where this now obtains
for Chris Imlay, Steve? Is the SBE petitioning for 2m? Is the ARRL
going after the TV bands? Do the parties have conflicting positions
on responsibility for EMC?

> Expressing an opinion that someone in a membership organization is
> out of line is part of the democracy of the organization ... right?

The criticism was not about membership behavior but about the
behavior of a professional employee of two membership organizations
in that employee's professional capacity. Chris did not lose his
rights to defend his professional reputation by joining one or more
of the client organizations.

If other stations are using DCD technology there should be NO
collisions? I run a Packetcluster system with as many as 23-26 users
and when a DX spot is issued, all connects are vying for slots to ack
the spot. We recommend using minimum TXD but most are using 400-800ms
with NO problems for over 5 years. I am sorry but I disagree with
your analysis.

Versions 1.3.X and later of the Linux kernel are supposed to
contain support for AX.25(and of course TCP/IP). However,
it is apparent that Linux development has been running wild the last
year or so, and I do not know of a stable release of the
kernel since version 1.2.13. Is this a case of too many cooks
in the kitchen?

I was really hoping that Linux was going to be the
O.S. for running AX.25 apps, but alas, I now think not.

>Check into persoft equipment at http://www.petsoft.com
>they use Radio (microwave I think) for line of sight LAN
>connections of up to 5 Miles.

This really leaves me wondering about the future of AX.25 ameteur packet
radio on 2m/220/440. Bandwidth restrictions in metropolitan areas pretty
much limit us to 9600bps. Other than keyboard-to-keyboard comm,
what's the point? This is way too slow to run TCP/IP and interface
with the Internet, so why not just go to 2Mbps ethernet bridges on 900Mhz,
and avoid all the amateur restrictions and politics?

Hmmmm, maybe I just answered my own question;
engrained-tightwad-ham politics will keep the amateurs running
at 1200bps - sheesh!

Bob,
1) WAB=Worked All Britain. It is the British Ordnance Survey Map
block indicator , which is used by radio amateurs to identify the
location of stations in Britain , mine is NH88.

2) With QRA is meant the Maidenhead- also called IARU -
locator,example: DM45AD ; mine is IO87AT

Hi Jim.

I run lots of script files for Procomm Plus...which kind are you interested in?

Heres one that will set you start up parameters, check your mail box (and if you have mail, show a dialog box and sound a bell, and bring it to the screen), open the chat and monitor windows.

I also run a lot of meta keys to do certain things automatically, if your interested in those, let me know and I will email them to you.

```
start>
PROC MAIN
transmit "^M"
waitfor "cmd:" 2
if not success
dialogbox 200 45 200 30 14 "Message from PROCOMM PLUS"
text 0 5 185 8 center "TNC not found! Aborting connection..."
enddialog
pause 5
destroydlg
goto end
endif
transmit "cmsg on/on^M"
transmit "echo off^M"
transmit "c n8wct-1^M"
waitfor "WAITING" 1
if not success
transmit "b^M"
goto begin
endif
dialogbox 200 45 200 30 14 "Message from the KPC-3"
text 0 5 185 8 center "You have new mail!"
enddialog
alarm 2
transmit "rm^M"
destroydlg
```

```
BEGIN:
sendkey ALT 0x4F
monitormode on
END:
ENDPROC

end>
```

Remember to edit it first to suit your needs, as this one will look for my mail box, N8WCT-1. :)

Take care.

>antenna. It is vertically polarized.

Ah, that's different. There shouldn't be any difference since signal
strength is a measure of carrier power, and that should be the same
in both cases. I don't know the keying method of the radio you're
using, but I do know that Icom HTs, which use the "leaky PTT" method,
can be *partially* keyed if the "leak" isn't sufficient. In that
state, they output considerably less power than when keyed fully.
Perhaps your radio isn't being fully keyed by the TNC even if it
doesn't use the "leaky PTT" method. You might want to hang a meter
on the PTT line and see if it is being pulled solidly low by the
TNC.

Sorry, Rob is correct. The reason you don't see the problem is that
all the stations are operating connected mode to the server, and ack
in turn as the message is repeated to each of them. They do *not*
via for slots to ack the spot. If you have 23 users connected, the
spot is sent 23 times, once to each of them in turn. There's no chance
for collisions in that setup (though it is hugely wasteful of channel
bandwidth because of the repetition), but it is very different from
normal packet activity.

Many of the 1.3.x releases are quite stable (the trick is knowing which ones.) The 2.0.x series (which is based on the later 1.3 releases) is "stable" although there are still bug-fixes being released. The ax.25 support in the kernel is pretty stable, but the ax.25 utilities keep being improved and new applications keep being introduced.

Gary, I don't believe you understand the way Clusters work. Yes, the
packet is sent to each of them but it is sent as one continuous
xmission. Then each station must ack the receipt and they are
fighting with each other. In addition, many are hidden from each
other and cannot help but collide on rare occasions. In fact most
stations reply within 20-30 seconds. We ask stations to set FRACK
depending on distance from the node, i.e., the farther away, the
longer the frack time but many ignore and use default params. In 5
years and literally gigabytes of transmissions, we have had almost no
disconnects except those caused by dust storms and power failures
(common in Arizona).

3892. Re: Linux and AX.25-TCP/IP

Newsgroup: rec.radio.amateur.digital.misc

From: znha@igs.net
Message-ID: <4t1a2g$6j4@host.igs.net>
Source record: 35638

I've had a lot of luck with InfoMagic slackware linux 1.2.13 (ELF)
as well as previous 1.2.10 patched up to 1.2.13. The ELF disk is
Nov 1995. Ax25 is on disk 3 under debian. Compiled fine, installed
fine, runs well. On one side is an ethernet card, gw.basement.igs.net,
and the other side is a tnc--gw.ve3ppe.ampr.org. On the air as I write.

One thing if find particularly nice is the ability to open several
windows from this machine (sun 4/20), run "listen -p" in one, telnet
in another, ttylink in a third. Longest uptime on 1.2.13 to date is
106 days, 43 minutes--and counting! The biggest problem is getting
linux to turn a deaf ear to some of the crap that JNOS can be configured
to emit. :-(It's almost too trusting.

73, Gord.

Source record: 35641

In article <4sp693$595@dewey.csun.edu>, hbcsc274@csun.edu (jerry wang) says:

Greetings,
I am trying to wire a cable for my BP-2 that is coming next week.
According to the Baycom help file, it says the following

>Well, now I have several phone cords that have different color schemes.

>Here's a picture from the bottom:
> ____
> ||||||
> | | <-- clip is underneath
> |____|
||
||
||
||
Reading it left to right, one is yellow, green, red, black.
Another one is black, red, green, yellow.
It appears that some of these phone cords are reversed. Which way is correct?
for now I did it the way of majority rules, which is most of the phone
cords I have are this way: yellow, green, red, black. I hope this is
right because I hate to take it apart and resolder it all.

HELP!
Jerry KE6UUX

Jerry:
My BP-1 fone cable, with the clip on the bottom has the following:

Left to right:
Black
Red
Green
Yellow

3897. The Future Of The Packet BBS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-23 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4t1vuv$ho8@thepit.trucom.com>
Source record: 35643

Hello, Folks:

There are those that believe that the days of the Packet BBS are numbered, if not already over. While I am not sure that I hold with this view, I found that many who state this position cite false or vague reasons. So I have been thinking about the idea for some time now and have come believe the following:

PBBS STATIONS ARE ON THE WAY OUT
(1) The advent of NOS has removed the need for a BBS to hold mail bound for an individual.
(2) Commonly available high speed modems (9600 bps +) has removed the speed advantage of the BBS/network over individual stations.
(3) Increased use of Internet and other wire-based networks for forwarding traffic has decreased the need for radio networks.
(4) Various policy decisions have stiffled the growth and development of effective HF long haul radio networks.
(5) Continued in-fighting in the Amateur ranks stiffles both long haul and short haul network growth and development.

PBBS STATIONS ARE NOT ON THE WAY OUT
(1) The majority of NOS stations are not on the air 7/24.
(2) There is readily available technology to allow PBBS stations to run at T1 speeds or better.
(3) With proper policy, an effective high speed long haul network could be built for very little additional expenditure.
(4) With proper guidance, the Amateur Packet Network could rival the Internet for both speed and ease of use.

All of this involves development of, at a minimum, all of the following aspects:
(A) New hardware systems.
(B) New software systems.
(C) New organizational structures.
(D) Wide Area Network policy, at least on a national basis, preferably on a global basis.

Over the next few days, I will be posting my thoughts and findings on these sub-topics over the next few days. I would encourage you to keep this message, perhaps printing it on hard copy, for reference.

I also encourage any input that you may have.

Please note that this is NOT being posted to Packet itself at this time due to the projected amount of traffic that may be generated. There are too many SALE, WANTED, and DEBATE messages on Packet to

allow the added bandwidth.

Take Care & 73

My Newark catalog has Z8530 family parts.

It appears you are from Clarkson College, which seems to be
in Potsdam, NY(the sticks). They have a Syracuse,NY branch
at (315)457-4873. If this is not close to you, you can call
information for any moderately-sized city, and get the Newark
branch telephone number.

I accessed this web page. Can this document be found anywhere in
other than HTML format? It will take me an hour to print this
incarnation of the document, as each subsection is contained on
a different web page. Didn't the Linux documents used to be kept
in FTP archives? Wasn't that better?

There is one useful purpose for the PBBS network. It keeps a large number of old fuddy-duddies busy, and is probably greatly reducing the noise level on the newgroups. I mean, can you imagine what the spamming will be like once all these SALE bulletin generators figure out that they can increase their output by 3 orders of magnitude? I'm shocked that this newsgroup is so spam-free.

I disagree. I find Linux more stable than Windows 95. (Okay,
that's faint praise.) It is stable enough to use for serious
work, and is so used by real enterprises. As you know, there's
a dual track to Linux development with even and odd releases
being either experimental or bug fixed. If you stick with
the bug fix releases, it is plenty stable to use. Just think
of how many times you've had to resort to the big red switch
to recover in Linux compared to the number of times you've
had to do it to Windoze. Big difference right? (And not in
Microsloth's favor either.)

I would note that if you try to apply every slight patch
or upgrade to Linux as it is released, you'll drive yourself
crazy, and have a full time job. But no law says you have
to do that. Only do upgrades as it seems prudent to do so.
For most purposes, you can run several revs behind and
still do your tasks adequately.

A Linux expert I know says it is now so stable that it has
become *boring*, that is unless you insist on being on the
bleeding edge of development. Me, I *like* boring in an OS
I depend on every day.

>
>
>
>
>

Yes, I have it, I wrote it. :-)

The full version has multiple connect support.

MACROs - which alow you to control PacketPeT or your TNC with
scripts which can be run from any of a number of macro players;
play now, play at a preset time, play at a specified interval,
play when any of 9 user difinable strings are received by the
TNC, play at program shutdown, play at program startup.

User definable menus, which allow you to put the filename of a
macro, or an executable program onto three additional dropdown
menus that are not in the Lite version.

Unlimited settings files, save your preferences so that you can
have many different configurations of the program; ie save one
for VHF, one of HF, maybe one for RTTY, etc...

Xmodem Chat file transfers; transfer files between two PeT users
and have a background keyboard chat.

Delete files without leaving PacketPeT.

Includes 114 Page printed user manual.

That is pretty much the list of features that I put in the full
version, that is not in the Lite Version. Let me know if you
have any specific questions.

73 Chuck

Check out the newest stable release of the Linux kernel: 2.0.
You can find it at ftp://ftp.funet.fi/pub/Linux/kernel/src/v2.0.
(The latest version is 2.0.8... I haven't verfied the state of the
AX.25 code, though....)

Would you rather have one cook (Bill Gates) who doesn't care how the

> in the kitchen?

I have no idea what you mean. The version 2.0.* kernels are fine,
and while there have been a spate of minor bugfixes that have led
to the latest release being 2.0.8, ALL of them have been fine for
AX.25 use.

The 2.0.8 kernel is the latest stable kernel and you should seriously
consider upgrading to it, there have been many significant improvements
to the AX.25 and NetRom support and the new tools are excellent.

> I was really hoping that Linux was going to be the
> O.S. for running AX.25 apps, but alas, I now think not.

Grab a copy of the AX25-HOWTO from:

http://sunsite.unc.edu/mdw/HOWTO/AX25-HOWTO.html

and go to it!

regards
Terry

Linux: Native AX.25 and NetRom support in your free-OS. No contest.

1200 baud AFSK has one, and only one, thing going for it. It'll
work through just about any FM voice radio you can find without
any modifications. That lets Joe HT hook it up and get on the
air with it. So it allows quick assembly of ad hoc networks to
meet a limited need, such as shelter logistics communications
in an emergency. (It'll even work through unmodified voice
repeaters in many cases.)

Except for a couple of purpose made data radios, 9600 baud is
going to require modifications to a FM voice radio to work
(despite radio manufacturer advertising hype of "9600 baud
ready" included with virtually every new radio marketed,
which really only means they included a jack labeled "data"
on the back panel). Joe HT isn't going to do those modifications,
and anybody capable of doing them is also capable of going to
the next level. So I see 9600 baud over FM voice radios as a
dead end. (If the manufacturers ever *really* make their radios
"9600 baud ready", then that would be a different story.)

The next step up is raw FSK at 19.2 kb. That's pretty simple
for anyone who knows how to modify a radio to do, but there
are a number of practical drawbacks, most pointedly, the need
for wider receiver filters. The better next step is to abandon
the FM voice radio paradigm entirely and move up to a 56 kb RF
modem. That can be used on 219 MHz, 222 MHz, or 70 cm under
current FCC regulations. The technology is proven, and is now
off the shelf from PacComm. No kludged FM voice radio is needed.
(But an ordinary transverter is.)

56 kb is a respectable data rate. While we'd all like to have
our own personal T1, most of us settle for a 28.8 kb connection

to the internet, and a 56 kb link is a step up from that. And, 56 kb is *as fast as the FCC will let us run below 450 MHz*, so we can't do any better while still taking advantage of the better beyond line of sight propagation offered at VHF and low UHF compared to high UHF and microwave.

This latter factor is what kills any idea of fast microwave networks. Amateurs form a *sparse* network. We aren't located convienently to form line of sight webs. We often need the ability to extend links beyond line of sight in order to reach the next station in the network. Topology of terrain, availability of relay sites, and finances often won't let us do that with microwave relay. We aren't AT&T Long Lines. We don't have condemnation powers, and we certainly don't have the financial resources to set up relay chains like Long Lines used to maintain. We have to make do, and VHF/UHF links let us make do better for our amateur networks than microwaves can.

Note, while beyond line of sight isn't impossible to do at microwave, multipath plays hell with our modulations when we start to approach T1 in a beyond line of sight environment. This starts to get exotic for Billy Bob packeteer to deal with. And it virtually demands carefully surveyed fixed paths, which eliminates the possibility of setting up ad hoc emergency networks.

Except in a few special locations where either amateur packeteer density is very high, or special terrain makes high site relay practical for the mass of amateurs, we need the ability to warp our signals past the line of sight to make the next hop. We're not going to do that at 900 MHz or above at baud much above 56 kb, at least not in enough cases to offer a general solution. We need power to burn our signals past the line of sight, and we need a low enough baud and robust enough modulation to tolerate the multipath that non-line of sight paths will offer (though SS can offer a partial solution to that problem). Right now, that's easier to do at 220 or 440 MHz at 56 kb than at 900 MHz or above at T1. The bits we need are all off the shelf.

In those cases were the path will support it, microwave relay at high baud (T1 or greater), is a great thing. I support anyone who wants to work in that direction. But I don't think it is a general solution to increasing amateur packet network speed.

It is also worth remembering that our objective is *not* to duplicate the internet. We can just use the real internet for that. Amateur packet should exploit the unique mobility and flexibility offered by wireless networking in order to perform the tasks amateurs are best suited to do. That doesn't

include being a common carrier in most cases.

Our greatest strength is our ability to quickly assemble ad hoc networks to meet a specific (and perhaps fleeting) communications need. We need to build on that strength. We usually don't need huge bandwidth capabilities, though we want as much as we can practically get without interfering with our ability to quickly configure flexible networks.

I don't see 1200 baud AFSK going away any time soon on 2m. It is literally the lowest common denominator for quick ad hoc networks. It is virtually a no-brainer solution to simple data transport needs.

To go beyond that, we need plug and play hardware, and robust protocols that are to the maximum extent possible self-configuring and self-healing. We now have an off the shelf answer to the fastest permissible hardware for 70 cm and below. We have TCP/IP. But we don't yet have self-configuring and self-healing layers in the system, IE automated self-actualizing dynamic routing and network management software. (Netrom is the closest thing we have, and that's not good.)

I've harped on the need for this self-configuring and self-healing property as far back as 1986. I know of some work that has been done in this direction, but I don't know of anything that's actually been put in place out in the field. If someone wants a project, this is a good one, and one with applications beyond amateur radio. It shouldn't need a centralized source of control or a centralized database. This lack of dependence on vulnerable centralized sites is essential to our need to be able to configure and heal our ad hoc networks. It must be peer based as much as possible, but it mustn't consume all our limited network bandwidth in the process.

Anybody want the job?

Gary

>longer the frack time but many ignore and use default params. In 5
>years and literally gigabytes of transmissions, we have had almost no
>disconnects except those caused by dust storms and power failures
>(common in Arizona).

The collision problem probably will not cause disconnects, it just
causes slow propagation of spots and inefficient use of the channel.
When you send out 23 spots in a single transmission and have the
users fight for the channel to send their ACK, what will happen is

that some of them collide and others will get their ACK through.
(partly because they suffered no collision, partly because their
transmission was stronger than another station).
Then, you will have less data to transmit the next try, and thus
less chance of collsions and more packets getting ACKed.
You should be able to get out all data within the 10 retries that are
usually set in a TNC.

Of course it still is hugely inefficient. The entire thing could have
been transmitted using a single UI frame with embedded sequence number
and no ACKs at all, plus retransmission requests from users that
have missed transmissions. But we have discussed that before.

3920. N6GN Microwave Data Link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-24 00:00:00 UTC
From: John Clark <clarkjc@craft.camp.clarkson.edu>
Message-ID: <31F5A3DA.28163FA9@craft.camp.clarkson.edu>
Source record: 35666

I'm trying to build a 10 Mbps version of N6GN's 2 Mbps X-band data link. I have a copy of _Packet: Speed, More Speed, and Applications_, but I'm having trouble finding one part. The receiver schematic diagram shows a component labelled SRA-1 mixer. I can tell that it's a doubly-balanced diode mixer, but where can I get one? Or do I have to build it myself? Would a NE-602 work? Can anybody help me? Thanks!

- John (N3IFG)

If you guys want to discuss lawyers and the ARRL, fine. Go for it.
But why does this discussion need to be in six different amateur news
groups ? Why not move it to one, maybe .policy, so those of us who
want to read it can, and those of us who don't want to don't have to
delete it six times every day when we download mail ?

Thanks,
Jim KH2D

(Yes, I know I posted this to all the newsgroups.....)

[snip]

>Rob

I dont agree. If a station is running no squelch, and is using CD detect, a
long TXD would cause more collisions.

explanation: Station A has a long TXD, and keys up, but no data is being sent
yet. Station B is using CD detect, and is ready to transmit...hearing no data,
station B WILL transmit, just in time for both stations to collide.

I suppose this would be one disadvantage of running CD detect, but fact is,
that lots, if not most stations in my area do it.

Take care.

>
> PBBS STATIONS ARE ON THE WAY OUT

> (5) Continued in-fighting in the Amateur ranks stiffles both long
> haul and short haul network growth and development.
>

The reason you stated here is by far the greatest reason the Amateur
radio community's wireless data network has stalled on the PBBS technology.
AX.25 networks don't require cooperation and central organization. (Buy
a TNC, hook up your radio, pick a frequency, and your callsign combined
with your operating frequency uniquely identifies your station.)
To implement any other type of networking scheme requires two things:
1) cooperation and acceptance by ALL participants, and 2) a centralized
way to manage and administer the network. You'll never accomplish #1
just because human beings are involved, and 2) it is next to impossible
because who would administer it, the FCC, the ARRL? Neither
organization is up to the task.

> PBBS STATIONS ARE NOT ON THE WAY OUT
> (1) The majority of NOS stations are not on the air 7/24.

I'd be interested in hearing how you made this determination.

> (2) There is readily available technology to allow PBBS stations
> to run at T1 speeds or better.

Most, if not all, readily available techonolgies were designed for TCP/IP or SNA
environments, not the AX.25 environment. This argument supports the position
that PBBSes, ARE on their way out and TCP/IP networks are on their way in.

> (3) With proper policy, an effective high speed long haul network
> could be built for very little additional expenditure.

As stated before, this would require cooperation, coordination, & planning. The
only way this would happen is if a few highly motivated individuals worked together
to implement this, (on their own), and then allowed the rest of the amaetuer community

to use their creation. Driving this from the other way won't work.

> (4) With proper guidance, the Amateur Packet Network could rival
> the Internet for both speed and ease of use.
>

Doubt it. Wire will always be faster than radio. Emerging technologies
such as ISDN, frame relay, ATM, etc., are already providing "T1 speeds
and better" into homes. Just wait until the cable TV companies start
providing phone and data services into your home. That coax of theirs has a
lot of bandwidth in it. Besides, local amateur radio data networks today
are linked together over wire, not radio. Why, because it is fast, easy,
and cheap.

I see no reason why discussions of this sort have to focus on "radio only"
implementations. The current ampr.org TCP/IP network is primarily radio,
but cities around the world are linked using the internet. What is to rival?
What I want from a network is connectivity to both other Amateur operator's
stations AND stations on the internet.

> All of this involves development of, at a minimum, all of the
> following aspects:
> (A) New hardware systems.

Agreed.

> (B) New software systems.

Disagree. The TCP/IP protocols are/and will do nnicely for this.

> (C) New organizational structures.

Agreed up to a point.

> (D) Wide Area Network policy, at least on a national basis,
> preferably on a global basis.
>

Agreed. Nowhere have I seen a "network master plan" on what, if
anything, Amateur radio as a whole would like to implement. I'm
not so sure it is needed anyway.

<Soapbox mode on>
At one point in this nations history, Amateur radio operators used to
push the technology envelope. Today, as a whole, Amateur radio operators
have been reduced to little more than appliance operators, especially in the
area of data communications. The commercial data communications industry
has blown right past the HAM community and is decades ahead in technoloogy.
How many HAMS are experimenting with true high speed data communications
networking technologies such as microwave, spread spectrum, or lasers? How
many cities have digital repeaters and why aren't digital repeaters listed
in the ARRL's repeater guide?

I'm glad your spending some time thinking about these issues Marty. The
trend in the commericial data processing world is to provide wireless
services. If we amateurs don't start demonstrating more effective use of
our bandwidth in these areas, we will find the FCC taking it away and giving
it to someone who will!

3928. WINPACK 5.53...HOW TO UNINSTALL?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-24 00:00:00 UTC
From: Jim Mitrenga <cjm009@email.comm.mot.com>
Message-ID: <4t5lbr$f34@brokaw.comm.mot.com>
Source record: 35674

Hi,

I recently loaded WinPack v5.53 onto our PC at home and find that I cannot use it. Consequently, I'd like to remove EVERYTHING that was put onto our hard drive. I read within one of the .DOC files, that the author deliberately DID NOT include an UNINSTALL.EXE program to remove the files as was in previous versions of the program. Evidently, the author wanted to conserve disk space for the updated program.

I also read that some files are embedded into the Windows and System directories as a result of the installation process. Do you know what files are put onto our hard drive as a result of the WinPack v5.53 installation? Can you give me the names and locations of these files?

HELP!

Thanks in advance,

Jim Mitrenga (N9ART)

That's a standard Mini-Circuits DBM. (800-654-7949 or 718-934-4500)
They have distributors, but they'll also sell onesy twosy quantities
to radio amateurs direct. Unit price is $14.95 in a recent catalog.

No. Flags are transmitted during the Txd interval. So if a station
hears the signal, DCD will be activated just as if the station were
transmitting useful data during the Txd period. The carrier is not
unmodulated during the Txd interval.

Hello Gary.

I just got done experimenting with my station. I set TXD to 255 (2.5 seconds). My station in fact (Kantronics 9612) has carrier only (no data) for those first 2 and a half seconds, after PTT has been made.

Perhaps I didnt make myself clear, or we are talking about something different...could you please follow up?

Thanks much.

Hi,
I did some testing with 9k6 modem connected to a TM733.

Forget it, it doesn't work. The transceiver is much to slow and modulates
the
PLL VCO. Results: lots of bit errors (retry's) when transmitting data.
Reception of 9600bd signals is ok, though.

How can it be that these manufacterers still advertise their stuff as being
'9600bd ready' ? It's clearly misleading. Especially in the USA, where
everybody sues everebody for the most stupid things (or so it seems here
in the european news :-)) one would expect a more correct information
in the advertisements..

Lots deleted here for brevity.

I agree but for another reason, at least in my area of the
country. That reason is the stupidity of the folks running the PBBS's
or coordinating them. In the Balt/DC area they take all the PBBS's and
put them on the same frequency (either Balt or DC). Then they allow
each of them to have several connections at the same time. And finally
they set it up so they pass the all the messages to each other during
the times most people are trying to access them. Then it takes forever
for someone to just see what's on the PBBS he calls home if he doesn't
get disconnected first. I reached the point recently where all I do
is use the DX cluster. That at least is reasonable.

Ahhh.... I'm linked to my ISP via a 173Kbaud spread spectrum link..
he is two miles away. I just completed last week a 2 megabit 11 mile
point to point RF link (using WaveLan boards). Granted, both were via
PART 15 technologies so I'd think a 'Amateur' implementation would be
far better. Remember, Marty stated "with proper guidance". Amateur radio
would make one hell of a 'last mile' or even point to point RF network.
The equipment is there.... we just collectively lack the vision to implement it.

More then you think. Check out SS@tapr.org. Problem is, most would rather
tinker then get politically involved fighting the amateur 'establishment'.
This is beinging to change, mostly due to outrage.

In the past, mine has been listed so there is at least one. (I assume you
mean a full duplex regenerating repeater... not a digipeater)

This is true. Home-brewing a device to operate under Part 15 is not practical. Amateur radio is really the only practical way to home brew any type of radio transmitter, except extremely low power. If the application is illegal under the amateur radio rules then give up and find something else to do. There are many things in this world to experiment with. It's a bad idea to get fixated on one application (except, of course, VHF contesting) unless someone is paying you.

Hi all
I just hooked up my new Icom IC-281h 2M mobile, and I have a few questions.

1) The manual leads me to believe that Tone Squelch is included in the US version. I can ENcode PL tones, but the rig won't DEcode them (I.E. I can't get ' T SQ ' to appear by following the directions).

2) Is there any way to monitor a priority memory channel while in MEMORY mode w/o transferring the freq. to the VFO each time I switch channels?

3) I know that these '9600 ready' synthesized mobile radios are not supposed to be too good at 9600, but I was curious if anyone had successfully used an IC-281 at 9600. If so, any comments/advice?

It would be helpful if responses could be emailed as well as posted if possible.

Thanks & 73
Dave N2VYP

Dave,

The CTCSS decode does require an optional board (Model UT-85). It plugs
in and doesn't require any adjustment.

I am using mine for 9600 baud and have no complaints at all. The data
doesn't look as solid on a monitor as a crystal rig, but still seems to
work fine.

I haven't used the priority monitor so I wouldn't be much help with it.

: Alan VE3XAG

Got it. Some folks are discussing a miscellaneous topic connected with amateur radio, but since Alan, VE3XAG, doesn't like it, it makes everyone in the thread lifeless childish twerps discussing a petty non-issue.

Sorry, we all got it wrong, Alan. And I'm very glad you're around to set us all straight. Since you're obviously an adult with a life, Alan, perhaps you should tell us all what to discuss. Maybe you could even guide us on the correct opinions we may hold on permitted topics, so that we don't keep making these mistakes and bothing your busy time to correct us; having a life must be so time-consuming. Maybe I'll find out one day.

Alan, when and how did you first discover that people who don't agree with you are lifeless childish twerps? I'm sure that knowing this must be a great comfort to you.

BTW, I apologise for omitting any personal insults in this posting. We childish lifeless twerps don't know how to write that way.

Again, Alan, thanks for your guidance. Please just drop in and give us the benefit of your wisdom whenever you find it necessary. And I do appreciate that you did it without any bitching, whining or complaining. We do all hate that kind of thing, don't we?

Regards,

Christisn Bock has a program (WXSat) for NOAA/Meteor APT satellite reception
at >>http://ourworld.compuserve.com/homepages/HFFAX<<. IT is a great
program. Brian has the demo version of his FTV HF/Satellite fax program.
While FTV is a DOS based program, it behaves quite well under Windows95.

The HFFAX site also has JVFAX 7.x(7.0 save gifs and 7.1 saves tifs).
JVFAX works well under Win95 but will require external "decoders".

Good luck

Well, its a week or so after I posted a question and the lack of
any answer makes me wonder if the fellow should get sued.

I ask my question again ...

Is there any rock solid evidence that the SBE and ARRL are opposed
to any particular issue? By "rock solid" I mean something like a
comment on a rulemaking from the SBE that would be contrary to an
ARRL position on the issue. Or maybe a SBE article that expounds
a position that is obviously anti-amateur radio.

Is the SBE for taking away 40 meters from the amateurs? Perhaps they
want two meters?

Anyone??? Something I can get a copy of ... a magazine article ...
something??? KG7FU???

Wrong. There's a hobby exclusion in part 15. (At least as of the
October 1991 copy I have on my desk.)

"15.23 Home-built devices.

(a) Equipment authorization is not required for devices that are
not marketed, are not constructed from a kit, and are built in
quantities of five or less for personal use." ...

And subparagraph b is about using "good engineering practice" where
the home builder is not able to test for full compliance.

> Yes, yes, yes. You are refering to a electronically steered phased array? I'd
been looking into something like this, but as I understood it, they were
expensive and only limited steering was available, IE +-30 degrees. If I'm
incorrect, or your refering to something else, please let me know.

What I had invisioned was something akin to the NASA ACTS satellite. That is,
a steerable 'spot' beam at a central high point, with the users all using
inexpensive fixed dishes at the central point. Access, due to the hopping
spot beam, would be 'token passing'. Due to the narrow beamwidth and requirement
to limit spot hopping, a means to 'log in' to the high data rate spot beam would
be need. This could be accomplished on a low data rate channel (like 9600) and
the user would pass his coodinates to the master station when he wishes to access
the spot beam. The spot beam then would periodically hop to the logged in user.
Logged in in this context means data is flowing to/from the user station.

Of course, if the user also can have a steerable array, that puts a whole new
spin on it. It would fit better into the amateur 'ad hoc' network model.

I agree!!! My company has several of the LYNX at 2Ghz operating and are
doing great...one 12 mile hop and some are as much as 28 mile hops!
No problems with them at all!

BTW his idea would be perfect with the LYNX since he would run a straight
T1 connection and at the internet provider would be able to pump right
into their router (maybe without using a DSU!)..

Gee I wish I had that problem!

Chris

>onto our hard drive. I read within one of the .DOC files, that the
>author deliberately DID NOT include an UNINSTALL.EXE program to remove
>the files as was in previous versions of the program. Evidently, the
>author wanted to conserve disk space for the updated program.

Quite true - if the uninstall had been left in, it would have made the
program too big to fit on 1.44Mb floppy, which would make distribution
by disk difficult. In the UK a single 1.44Mb disk in an envelope can be
sent on the lowest postage charge. Many hundreds of hams all around the
world have received the program by sending a disk and a stamp to one or
two kind souls who have been happy to spend their time making copies. If
they'd had to copy two disks for ever request, it would have virtually
doubled the amount of work.

>I also read that some files are embedded into the Windows and System
>directories as a result of the installation process. Do you know what
>files are put onto our hard drive as a result of the WinPack v5.53
>installation? Can you give me the names and locations of these files?
>
>HELP!

Don't stress! If you -
CD \
DELTREE WINPACK

and answer 'Y', that will remove virtually everything.

Some Visual BASIC run-time files are put in WINDOWS\SYSTEM, but only if
they are not originally there. They are -
VBRUN300.DLL
THREED.VBX
CMDIALOG.VBX
MSCOMM.VBX
MCI.VBX

You should not attempt to remove them because they may be used by other
VB programs on your system. If you really feel a need to get rid of them
(other than using a few hundred kb of disk space, they will do no harm
at all), then remove them in a way that enables you to put them back, in
case another app needs them and you don't realise it!

The only other file that is put in WINDOWS\SYSTEM, which you can remove if you want, is -
G4IDE7PL.DLL

Finally, remove the WinPack program group from Program Manager by highlighting it and then using "File", "Delete" on the Program Manager menu.

That's it. No changes are made to any Windows INI files, or anything like that.

Hello everyone

I have read in a newspaper the following article about A new company in USA has established a new & great service. They are ready to find any person's adresses anywher in the world .

So if someone met any person anywhere in the world for a short time in an airport, hospital, confrence, company and so on & had a little information about him, they will be able to find this person's adress.

The bad thing that the newspaper didn't mention their adress or Email adress. If anyone have any information about this company, please replay to me. Thanks alot.

REGARDS

I am looking for some good but cheap Spread spectrum gear for comm's between a couple of RS 232 ports (line of sight approx 5 km). Is this possible or is "cheap" and "spread spectrum" two mutually exclusive events? I would also like some information on licensing requirements in Australia. If anybody can help, much appreciated.

Regards
Justin Keating

Hi all,

I am very much interested in home entertainment and the use of it. I would hereby like to ask people to tell about some things about satellite broadcasting, digital radio, and Pro Logic.. What is the current state of technology? Who is offering what? Which companies have the best products, what are the trends nowadays and what do you think will happen in the future with the technology? Is it already available in the US and elsewhere in the world? And if so, how etc? I'm a student and I'm doing some research on this technology...

Cheers, Bas.

3960. RE: Digital Microwave Radio - 1200bps stinks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-25 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10722@wb9mjn.ampr.org>
Source record: 35694

Hi Gary,

Well, Yea, I think we need a manufactured 9600 baud GFSK data radio. The D4-10 is getting pretty scarce, as are surplus Motorola MITREK's. The TEKK's are fine for short range point to point cservice, but not for general omni usage.

The 56 KB system has some disadvatanges over 9600. It costs twice as much. And, while the 56 KB system is worth it, that cost is a problem for many. Few areas have 440 56 KB regenerator coordination, and even thos that do, have problems utilising it, mostly due to non-packet ham sour grapes. 440 is too low a frequency to do much with directivity based reuse, in metropolitan areas. Thus regenerators are highly desirable. 9600 baud regenertors are easy to coordinate and build, given available repeater pairs.

I really don t see any difference between microwave and 56 KB user access. They are both equally as sparce in most of the U.S.. While 440 may be able to punch thru trees better than microwaves, microwaves have better fresnel clearances, enviormental noise and the point to point antenna multipath advantage. Things are about equal, as i see it. True, 440 is our best omnidirectional band for fixed to fixed station application. But, multipath can be a problem, even for 9600, let alone 56 kb. There are stronger reflections at microwaves, as the the number or objects that are large in terms of wavelengths is more. But, microwave antennas can tightly focuse energy, and avoid many long differential delay reflections.

56KB 440 gear is pretty sparce right now. Microwave even more so. But, as far as 56 KB 440 having a deployability advantage over Microwave gear, I think you are wrong, with the whole U.S. as the area of interest. 56 KB 440 is just as "out there" as anything microwave, in most of the U.S.. So, the two systems are about equal in this respect.

If u think of Microwave systems in the terms of fixed ATT style radio system, you have some points. But, who says we cannot "versatilize" the microwave point to point, fixed to fixed system. I think the key to this is a the electronically controlled azimuthal scan antenna along with matched filter DSSS.

With such an antenna, directivty as well as topographically limited range can be used to reuse spectrum-time. The "exposed terminal" can point at station intended to recieve the data, leaving all the other stations in neighboring valleys the spectrum-time to communicate.

Matched Filter DSSS locks up very quickly. About in a symbol time, versus 100 to 500 symbols for MSK and .5GFSK technologies. Thus, when the antenna beam is shifted, little on-air time is wasted, waiting for the modems to re-

lock. DSSS helps with multipath, as well.

Such a system would need self-configuration not only as a working feature, but as a neccassity. Anyone who has operated VHF/UHF weak signal DX with a long yagi can understand this. Until two station are pointed at each other, its very hard to even tell if there is a another station on frequency. At microwaves, this situation would be the SOP. Automatic schemes for finding and logging dirrections of neighbors would be needed.

This type of system, if built into an antenna/radio/ethernet interface combination of subsystems, would then have general application at any ham's location. One would just plug it onto one's ethernet, and let it run. It would be simple, and Joe HT could deploy it by simply reading thru his computer's on-line help files (to get the Ethernet configured).

73, Don.

>HELP!
>Jerry KE6UUX

Jerry:
I am using the BP-2 now.
It comes WITH the phone cord. All you have to do is terminate the color coded wires with the appropriate plug(s) for your radio. I'm using a Yaesu FT-23R HT, so I used 1 mini and 1 micro plug to mimic a speaker-mic I/O. Works pretty good with my HP200LX as the terminal. I'm upgrading to version 1.60 of Baycom to take advantage of RS-232 DCD, as soon as the disk gets here.

3963. The Future Of The Packet BBS - Item OUT 1

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-25 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4t7386$q6g@thepit.trucom.com>
Source record: 35697

Hello, Again:

As I said in my original post, I will be discussing my thoughts on the individual items one at a time. This is the first comment...

> PBBS STATIONS ARE ON THE WAY OUT

> (1) The advent of NOS has removed the need for a BBS to hold mail
> bound for an individual.

First of all, let me say that when I refer to NOS, that includes a wide range of programs on many platforms.

Next, I am NOT going to get into a discussion of Packet <-> Internet gateways... That is beyond the scope of this posting and involves a lot of subjective topics.

NOS and its TCP/IP implimentation allows Packet Users to send mail DIRECTLY to each other without the need of the "store and forward" provided by the current crop of PBBS programs.

This feature, like so many things, is a double edged sword and has both advantages and disadvantages...

Some advantages are:
(A) Faster contacts with others. That is, no need to wait a week for the message to drift through the maze of PBBSs to reach its destination, if it ever does.
(B) Allows users to be an active part of the Network.
(C) Encourages the development of multiple redundancy in a LAN.
(D) Allows long distance keyboard to keyboard contact.
(E) The FTP functions offer a dramatic increase in file transfers over 7+, YAPP, etc..

Some of the disadvantages include:
(A) Few individuals will leave their station up 24 hours a day, 7 days a week. This causes a breakdown of the Network.
(B) Requires a computer to be on, not just the TNC.
(C) Many NOS systems are hard to set up.
(D) In many areas, NOS is not well received by the Ham community.
(E) TCP/IP Routing is a mystery to many Hams.
(F) Poor handling of Bulletin and NTS traffic.

TCP/IP and its related functions offer a very much needed improvement in Packet Radio. Things like Telnet, FTP, NNTP, SMTP, and others could offer great opportunities for Hams.

Many, if not all, of the disadvantages could be overcome by the use of PBBS stations. These stations would stay on the air 7/24 and serve as POP and other Servers for the rest of their LAN. They could also handle the task of processing Bulletins and NTS messages.

The problem is that the current crop of NOS programs don't support these features very well and the current crop of PBBS programs don't support TCP/IP very well.

What is needed is a new "generation" of hybrid NOS/PBBS programs.

In practice, a Network User does NOT need all of the functions now in the NOS programs. A good analagy is the use of Dial-Up access to the Internet... When you call your Internet Service Provider (ISP), you make a PPP or SLIP connection and your machine is assigned a Dynamic IP Address. Effectively, your computer is then directly connected to the Internet. When you hang up, however, the network continues to function just fine because your computer does NO routing. That is all done by the ISPs around the world.

Packet TCP/IP should work the same way. There should be NO individual stations that are a part of the routing chain. Only Nodes (analogous to an Internet router) and BBSs (analogous to an ISP) should be involved in the actual transfer of traffic.

This eliminates the big problem with NOS of having part-time stations in the forwarding loop.

This brings me to just what software would be needed to impliment such a system. As I see it, there are three basic software systems that would be needed:
(1) PBBS/NOS System: This would be the ISP of Packet Radio. It should have full TCP/IP functions _PLUS_ all the functions of a "normal" PBBS. It should support Windows operating modes ON BOTH ENDS of the connection... That is, it should run under Windows on its computer and support GUI on the User's end as well.
(2) Node System: This is the software/firmware used in the various nodes of the Network. TheNET X1-J is a good start but seems to need some further work to add more abilities. Perhaps it is also time for a new TNC design based on a more powerful processor... 80386 systems are cheap right now. ;-)
(3) User System: This would be, for lack of a better term, the Netscape of Packet Radio. It will handle the "Dial-Up" to the local PBBS and provide a full Windows interface. Flavors for many platforms could be done in a simple manner including: DOS, Windows 16/32, Amiga, Mac, Atari, Unix, Linux, etc..

For all software, ease of installation and use and GOOD documentation are the paramount requirements. In the Ham world, there are many good programs rendered all but useless due to their poor documentation. We have all seen them.

This concludes my initial comments and thoughts on this topic. I welcome and encourage any further coments that you have as well as any

questions. I do, however, have one request if you make comments or have questions...

PLEASE POST ALL COMMENTS AND QUESTIONS TO THE NEWS GROUP FOR ALL TO SEE! THE IDEA HERE IS TO GENERATE DISCUSSION AND THOUGHT AMONG HAMS.

Feel free to copy me via private mail as well, but ALWAYS post to the Group.

Thanks for your attention.

Take Care & 73

Amen Brother. But I think those guys can advertise now, at least all
the ambulance chasers in California sure are paying for a lot of TV
time.

3966. The Future Of The Packet BBS - OUT 2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-26 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4tadvm$nn@thepit.trucom.com>
Source record: 35562

Hello Again:

In this post, I would like to discuss reason number of why Packet BBS stations may be on the way out. Quoting from my original post:

> PBBS STATIONS ARE ON THE WAY OUT
> (2) Commonly available high speed modems (9600 bps +) has removed the speed advantage of the BBS/network over individual stations.

Up until just a few years back, any packet speeds above 1200 bps were both expensive and hard to impliment. The only stations that could really afford to have a "high speed" link were some nodes and PBBSs.

Today, however, with the advent of cheap 9600 bps TNCs like the Kantronics 9612 and the various 9600 bps ready (more or less!) radios, the cost of a 9600 bps station is only marginally more expensive than a 1200 bps station and no harder to set up and run.

This is, to an extent, over-simplifying the set up of a 9600 bps station, as anyone who has set one up will know. Regardless of how hard it is now to set up a 9600 bps station, it is many times easier today than it was even 5 years ago!

The fact of the matter is that most PBBS stations are still running at only 9600 bps for their "high speed" link(s). Many new Wide Area Networks (ie "back-bones") are also being built at 9600 bps. In other words, the USERS can easily be running at the same speed as the NETWORK!

Not only does this mean the end of the useful life of the Packet BBS but it also spells doom for WANs in general.

Again using the Internet as an example, how many users have T1 or faster direct access to the Internet? About the fastest around are at 128 Kbps while even the smallest ISP has a "fractional" T1 at 256 Kbps. Most moderate ISPs use full T1, T3, or multiple T1 feeds.

Ideally, the Packet Network should be operating at no less than 56 Kbps. This provides high speed links over long distances and allows users to access at 9600 bps without delay problems. A single 56 Kbps path could support as many as 6 full speed 9600 bps connections at the same time.

There is hardware available to allow even faster speeds for packet, even up to T3 speeds, but it is very expensive and allowed by Part 97 only in the high UHF and microwave bands. Due to the nature of Amateur Packet Radio, we may have problems here due to the distances between

sites. (see an excellent recent posting by Gary Coffman for a more detailed discussion of this)

Again, please feel free to discuss this topic, BUT PLEASE DO SO IN THE NEWS GROUP FOR ALL TO SEE!

Thanks for your time.

>

Was doing some research on this subject on the Web. Right now prices
are fairly high(about $600-$2000 per seat, depending on capability),
due to high component costs. It is predicted that component costs will
drop rapidly after the 802.11 wireless LAN standard is approved
(sometime soon??). Apparently the Taiwanese are poised to jump into
this market when component prices fall. Hopefully by 1Q or 2Q of 1997
we will begin to see cheap wireless LAN products!

>way to manage and administer the network. You'll never accomplish #1
>just because human beings are involved, and 2) it is next to impossible
>because who would administer it, the FCC, the ARRL? Neither
>organization is up to the task.

Point 1) Agreed, to a degree. See below...

Point 2) Perhaps a new organization? It is clear that such a network
is possible. While I hate to keep using the Internet for an example,
it is the best one around. Bottom line is that a central group/agency
or what-ever will be needed.

>> PBBS STATIONS ARE NOT ON THE WAY OUT
>> (1) The majority of NOS stations are not on the air 7/24.

>I'd be interested in hearing how you made this determination.

Simply by chatting, PINGing, and reading notes from folks passing
through the network. I would like to see a true study of this. My
"back of the envelop" tally shows that only about 30% of all NOS
stations stay up 7/24.

>> (2) There is readily available technology to allow PBBS stations
>> to run at T1 speeds or better.

>Most, if not all, readily available techonolgies were designed for TCP/IP or SNA
>environments, not the AX.25 environment. This argument supports the position
>that PBBSes, ARE on their way out and TCP/IP networks are on their way in.

Exactly! But this assumes that we are talking about PBBS and NOS
systems in their current incarnations.

>> (3) With proper policy, an effective high speed long haul network
>> could be built for very little additional expenditure.

>As stated before, this would require cooperation, coordination, & planning. The
>only way this would happen is if a few highly motivated individuals worked together
>to implement this, (on their own), and then allowed the rest of the amaetuer community
>to use their creation. Driving this from the other way won't work.

Perhaps the use of the word "policy" could have been replaced better
by "regulation"... What I was really refering to are the FCC Rules for
low VHF and HF digital modes. While in the HF spectrum, there may not
be room for anything much faster than 1200 bps, there is little reason
to have 6m limited as it is now.

>> (4) With proper guidance, the Amateur Packet Network could rival
>> the Internet for both speed and ease of use.

>Doubt it. Wire will always be faster than radio. Emerging technologies

>providing phone and data services into your home. That coax of theirs has a
>lot of bandwidth in it. Besides, local amateur radio data networks today
>are linked together over wire, not radio. Why, because it is fast, easy,
>and cheap.

hoo boy! Are the radio purists gonna get you! ;-)

T1 and faster speeds are entirely possible right now. All of the local
ISPs here have T1 lines (3 have the dreaded "Fractional T1"!) We can
do that. T3 is not out of the question for WANs.

>I see no reason why discussions of this sort have to focus on "radio only"
>implementations. The current ampr.org TCP/IP network is primarily radio,
>but cities around the world are linked using the internet. What is to rival?
>What I want from a network is connectivity to both other Amateur operator's
>stations AND stations on the internet.

See above for Flame Alarm...

I personally agree. I see no rivalry.

>> All of this involves development of, at a minimum, all of the
>> following aspects:
>> (A) New hardware systems.

>Agreed.

>> (B) New software systems.

>Disagree. The TCP/IP protocols are/and will do nnicely for this.

The NOS systems need to be made much more user friendly.

>> (C) New organizational structures.

>Agreed up to a point.

I have no answers, but I admire the questions. ;-)

As you said above, the FCC can't/won't do this. Even if forced to do
so, they would turn it over to some 3rd party.

The ARRL can't do it and should not be allowed to even try. The ARRL's
track record on the digital modes is dismal and shows that there is no
interest in promoting the growth of Amateur digital systems.

TAPR? Maybe... The uproar over their new HA specs a couple of years
back makes me wonder, though... Seems there was a serious failure to
get input on a global scale.

>> (D) Wide Area Network policy, at least on a national basis,
>> preferably on a global basis.

>Agreed. Nowhere have I seen a "network master plan" on what, if
>anything, Amateur radio as a whole would like to implement. I'm

I believe that such a plan is an absolute requirement. Again, however,
we are stuck with just who develops the plan.

Well said, Tony! It is sad to see Hams, who once were the leading edge
of electronic technology, now relegated to using 15 year old systems
and fooling themselves into thinking it is state of the art.

Amen!

From my home (I live in a very rural area), I can work six 2m
repeaters. From about 9am til 4pm and again from about 9pm til 7am,
there is almost no traffic on these 6 machines. This makes it a little
hard to justify the spectrum they occupy.

Thanks for your thoughts, Tony!

That ties in with the need for a truely functional group that would
control and direct network development.

Thanks for your comments!

>
> In this post, I would like to discuss reason number of why Packet BBS
> stations may be on the way out.
>

Your point about 1200 baud being too slow is well taken, but alot of PBBS forwarding is taking place over internet now, where it used to all go by radio. The user access to the mailboxes is 1200 baud in most cases, which is still adequate for the content! The question is, why would anyone want to be on packet at 300 or 1200 baud, when they could be on internet at 28.8? (Why am I there? Hi Hi)

But why not ask why people are still on packet running XT computers and DOS sofware? Why do people still use CW? Beats me? :-)

I would hope that over time our packet networks will get upgraded to 9600 baud or higher, but until an unskilled person can plug a TNC into a $300 or less radio, and have it come up running, we will continue to be stuck like we have been for the last 10 years!

We need true "plug and play" high speed packet; that is the advantage of 1200 baud, it is plug and play, works on just about any old FM radio you can buy at a hamfest; even the old crystal controlled ones you buy for $50! Getting on 9600 or higher is just one big and usually expensive hassle! It oftens requires surgery on radios, that will void warranties (and I believe) make them unusable for normal voice modes afterwards. The radio must now be a dedicated digital radio, and many hams just are not able / willing to dedicate a radio to packet full time.

Until / unless this situation changes, we will stay on 1200 baud and stagnate. The vision I have is of a new packet network that has its own version of the World Wide Web running it, accept connected together by amateur radio links & servers. We can't come close to anything like this with current hardware. And for most users, what packet currently has to offer, does not justify their expense / trouble to upgrade to a higher baud rate, just to access the same bulletins from packet mailboxes, but at a faster rate.

Seems to me we are stuck, and it wouldn't surprise me if 10 years from now we are sitting here having this same discussion, or having it on 2 meter packet at 1200 baud!

There certainly has been very little progress over the last 10 years!

Joe,

Most handhelds key the radio by grounding the mike line through a
resistor. A 1k resistor across the mic line and ground will key the
radio. Then the audio is fed through a small cap (.01) to modulate the
radio with the data. The cap is connected to the mic line of course.

Modulating the VCO is quite a common problem and one I came across when
modifying a Kenwood TM702e. There is a work-around IF you are using a
G3RUH board. The answer is to double the size of the TX eprom and
program the first half to transmit silence.....with the 2nd half of the
eprom containing the normal TX waveform data. A single FET (switched by
the PTT line) is then used to switch in the relevant half of the eprom.

I totally agree with Joop about the '9600bd ready' adverts being
misleading. I have yet to come across a single one of those rigs that I
would call 'ready'.

If anyone wants further details on the above mod, or requires the eprom
image. then feel free to e-mail me.

> provided by the current crop of PBBS programs.

This is only true within a connected network. An end-to-end ip path
is required, otherwise store and forward is used, exactly as in the
AX.25 BBS network. NOS itself provides no different functionality
than any other store and forward BBS code.

i.e. the network protocol does not enter into the issue: the exact
same means of moving a message is available no matter which protocol
(tcp/ip, NETROM/AX.25, TOR) might be used for the connections between
the BBS systems. If there is a direct network path between the two
stations involved, then there is no intermediate storage required.
If there is not a direct network path, then intermediate storage is
required.

> This feature, like so many things, is a double edged sword and has

>
> Some advantages are:
> (A) Faster contacts with others. That is, no need to wait a week
> for the message to drift through the maze of PBBSs to reach its
> destination, if it ever does.

See above comments.
The delay time is determined by networking constraints, and not at
all by "store and forward delays". Those delays can be made as long
as the sysops choose, or as short as the network connectivity allows,
no matter what protocol is used for the transport.

> (B) Allows users to be an active part of the Network.

As do all the other protocols.

> (C) Encourages the development of multiple redundancy in a LAN.

See above. This has nothing to do with the protocol used.

> (D) Allows long distance keyboard to keyboard contact.

Here tcp/ip has fallen down badly. Long distance real time connectivity
has never (to my knowledge, and I have been looking for it) been accomplished
using tcp/ip as the transport.

> (E) The FTP functions offer a dramatic increase in file transfers
> over 7+, YAPP, etc..

"Dramatic"? It's the same bits going down the same pipes.

> Some of the disadvantages include:
> (A) Few individuals will leave their station up 24 hours a day, 7
> days a week. This causes a breakdown of the Network.

I observe the opposite: the majority of the users I know about leave
their systems on 24/7 and many run one form of networking or another.

> (B) Requires a computer to be on, not just the TNC.

Not true.

> (C) Many NOS systems are hard to set up.

I'd say "... all ...". And yes, I've tried most of the flavors of NOS,
including my own personally modified version.

> (D) In many areas, NOS is not well received by the Ham community.

And in many areas, it is well received. But from my own observations,
NOS is not at all popular with the large majority of hams.

> (E) TCP/IP Routing is a mystery to many Hams.

And to many network experts.

> (F) Poor handling of Bulletin and NTS traffic.

This can be fixed without a great deal of effort.

> TCP/IP and its related functions offer a very much needed improvement
> in Packet Radio. Things like Telnet, FTP, NNTP, SMTP, and others could
> offer great opportunities for Hams.

The hams I have spoken with have never mentions those protocols,
and in fact have mostly never heard of them. They want to chat
with other hams, read messages, download files, etc. Hams don't
care what program they have to run to do these things. They do care
that the program be easy to install on their Win 95 computer ...

> Many, if not all, of the disadvantages could be overcome by the use of
> PBBS stations. These stations would stay on the air 7/24 and serve as
> POP and other Servers for the rest of their LAN. They could also
> handle the task of processing Bulletins and NTS messages.

Exactly. We call them "Store and forward BBS systems".

> The problem is that the current crop of NOS programs don't support
> these features very well and the current crop of PBBS programs don't
> support TCP/IP very well.

And the current crop of NOS programs don't support tcp/ip very well either.
(Yes, I can discuss this at length if anyone is interested).

If the KPC-9612 is truly causing a dead carrier to be transmitted for
2.5 seconds, then it is broken (perhaps by the factory). The protocol
requires flags to be transmitted during Txd. And if operating at 9600 baud,
the K9NG/G3RUH specification modem's scrambler will be active anyway, and
should be sending a signal from which data clock can be derived (that's
what the DCD detectors actually look for). The DCD doesn't care what is
sent, as long as it can lock to a valid clock.

The UT-85 "Tone Squelch Unit" is the option needed to decode CTCSS ("P.L.") tones with this radio.

Hello All,

I have a very wierd problem, well probablly not wierd to somebody who
knows the answer but here goes anyhow.
I have a tiny 2 tnc running thenetx1j4, and this in turn is linked through
to Linux on the serial port, sometimes when I try to log in local to
the node it disconnects as soon as a connect happens.
The node runs in kiss copy all, and connection locally is via call tnc1
nodecall.
Today, I tried a connect and the sta light came on full brightness
and I had to reset, next the sta light went out completly and
this keeps happening, it seems the eprom is not switching over
fast enough but x1j2 worked fine on the same tnc so is it a
problem with the tnc or the software or me ;)
any help appriciated..

This means your TNC is broken. Either by design, or just your unit.

>Perhaps I didnt make myself clear, or we are talking about something
>different...could you please follow up?

Gary is right in that a TNC during the TXDELAY interval should send flags.

Even sending zeroes, as some TNCs can do, is not really a good idea.
Sending a blank carrier is just plain wrong.

>organization is up to the task.

As noted, centralized control is a near political impossibility on
amateur radio. But what may not be so obvious is that it would be
a bad thing if it were possible. The primary advantage the amateur
network has is its ability to operate *without* vulnerable central
control points. Whatever scheme we adopt, it must be decentralized,
as self-configuring as possible, and as self-healing as possible.
That plays to our strengths and reduces the vulnerability to our
weaknesses.

[snip]
>> All of this involves development of, at a minimum, all of the
>> following aspects:
>> (A) New hardware systems.
>
>Agreed.

Probably not essential. There is adequate hardware already developed.
Getting it deployed is a different matter, of course. The only area
which really needs more R&D is HF (though more work on extremely

fast *local* network systems would be useful too).

>> (B) New software systems.
>
>Disagree. The TCP/IP protocols are/and will do nnicely for this.

TCP/IP protocols are useful for *internetworking*, IE they run well
on top of various lower level protocols. But they don't currently
offer self-configuration or self-healing at the physical and link
layers. In fact, routing is static in current implementations and
must be managed by hand based on external knowledge about the network.
That's a major problem. A robust network needs to be able to function
solely on internal knowledge of the network.

3988. WAMPES and a PK-12

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-27 00:00:00 UTC
From: perry@alpha.jpunix.com
Message-ID: <87rapx4u9a.fsf@alpha.jpunix.com>
Source record: 35584

Hello:

I just installed WAMPES-950403 under FreeBSD 2.1.0. I'm using
a PK-12 TNC in KISS mode hooked to /dev/cuaa2. net starts fine but as
soon as I try to issue a connect command or if the host tries to send
anything to the TNC, the STA light comes on and stays on and nothing
happens. The manual for the PK-12 says that the STA list shows host ->
TNC communications whereas the CON LED shows TNC -> host traffic. The
CON LED appears to be normal. I appear to be having some possible flow
control difficulty? going from the host to the TNC. About a year ago,
I experimented with the WAMPES software and had this exact same
problem. Ultimately someone mailed me some information that fixed
it. But I don't seem to have it anymore. Here is a copy of my net.rc
file as it stands.

Lan-link is a multi-mode software package that is quite nice. The latest
version is 2.34 and must be somewhere on the Net. If you search for it, make
sure to use the hyphen :)

Hi Dave,

I have done some testing with the IC481E (European 70cm version of your
IC281h) and it performed very poorly with 9600bd packet. BBS downloading is
ok, but transmitting long packets produces lots of retry's.

The radio also suffers from very slow tx<>rx turnaround time. IMHO the
radio is NOT 9600 ready.

After having bought and read several books on Packet Radio, I can highly recommend "INTRODUCTION TO PACKET RADIO by LARRY KENNEY, WB9LOZ". It is on the WWW at URL:

http://itg-pc1.acns.nwu.edu/~odenbach/classes/c96/packetradio.txt

Although it is oriented to the operational aspects of Packet, it is a great starter package for Hams. I have passed it out to 3 different radio clubs and all agree it is the way to start.

I have contacted Larry and he has "donated" this excellent work to Amateur Radio.

Our compliments Larry.

>are fine for short range point to point cservice, but not for general omni
>usage.

Well, I think 9600 isn't the best choice for the local net, which needs
high speed to support intensive applications. But it will do for longer
haul between LAN links. Those are point to point, so the low power of
the TEKK is offset by the ability to use gain antennas.

> The 56 KB system has some disadvatanges over 9600. It costs twice as much.
>And, while the 56 KB system is worth it, that cost is a problem for many.

Yeah, it costs twice as much, but it delivers 6 times the performance.
It is now off the shelf and basically plug and play, unlike most 9600
options which require a voice radio be modified. Many hams devote a
dual bander to packet, and the combination of that with a 9600 baud
TNC costs about the same as a 56 kb setup, but performs much worse.

>Few
>areas have 440 56 KB regenerator coordination, and even thos that do, have
>problems utilising it, mostly due to non-packet ham sour grapes. 440 is too
>low a frequency to do much with directivity based reuse, in metropolitan areas.
>Thus regenerators are highly desirable. 9600 baud regenertors are easy to
>coordinate and build, given available repeater pairs.

Regenerators can be highly desirable, but they don't have to be limited
to 70cm. We have one on 222 MHz too, and you could put one on 33cm or
23 cm if you wished (it's just a different transverter, though you may
have to use double conversion). The new GRAPES modem has regeneration
built in for just such uses, nothing to build, plug and play.

Coordination is a political issue, and you have to address it politically.
There's no hardware fix, you just have to do the hard and dirty grassroots
politicking to get the coordinations you need. It takes strong packet
organizations to do that, and it takes time, but it can be done.

> I really don t see any difference between microwave and 56 KB user access.

>at microwaves, as the the number or objects that are large in terms of
>wavelengths is more. But, microwave antennas can tightly focuse energy, and
>avoid many long differential delay reflections.

The problem with microwave is that you become locked into point to
point paths. You need either a central hub, or a planned series of
point to point links interconnecting the stations of the LAN. That
leaves the network vulnerable to single point failures. By abandoning
omni-directional ability, you compromise LAN robustness. That's a tradeoff
that has to be made very gingerly.

> 56KB 440 gear is pretty sparce right now. Microwave even more so. But, as
>far as 56 KB 440 having a deployability advantage over Microwave gear, I

>is just as "out there" as anything microwave, in most of the U.S.. So, the
>two systems are about equal in this respect.

No, it is more deployable because there's an off the shelf modem,
off the shelf transverters, and off the shelf data pumps which can
be used to implement it. None of the faster microwave proposals have
that.

> If u think of Microwave systems in the terms of fixed ATT style radio system,

>can be used to reuse spectrum-time. The "exposed terminal" can point at sta-
>tion intended to recieve the data, leaving all the other stations in neighbor-
>ing valleys the spectrum-time to communicate.

That is certainly an exotic idea, but it has the flaw that the receiving
station must still be omni. It can't know a priori which other station in
the LAN may wish to address it, or when, so it must always be listening
for *any* station's packets which might be directed toward it. This
drastically reduces the spatial frequency reuse possible since it is what
the receiver hears which determines collisions or lack of collisions.

> Matched Filter DSSS locks up very quickly. About in a symbol time, versus
>100 to 500 symbols for MSK and .5GFSK technologies. Thus, when the antenna
>beam is shifted, little on-air time is wasted, waiting for the modems to re-
>lock. DSSS helps with multipath, as well.

DSSS has a lot of things going for it, but it doesn't solve the problem
mentioned above. It would be useful in a *omni* net, however, because
stations could address each other by their spreading sequence and have
essentially the same advantage of stations operating on an exclusive
frequency. The only time collisions would be a concern would be when

more than one station tries to send to the same station. The rest of
the time, they're sending to stations with other spreading sequences
and only slightly raise the noise floor of others using the channel.

Gary

Snort! "9600 baud ready" my a**! No synthesized voice radio which
inserts modulation in the synthesizer loop is "9600 baud ready."
And that's almost all of them.

Your traffic analysis model is flawed. I elaborated on this in another
post, but to rehash for a moment, the internet is a bad model for
amateur packet networks. A more useful model is of an ethernet LAN
with a dial up long haul gateway to other LANs. The reason for this
is *latency*. Hop counts for fast RF backbones are high, and that means
latency is high.

The internet avoids this by having long haul direct wired links to keep
the hop count down (the hop count to anywhere in the world on the
internet seldom exceeds 4 or 5, and never exceeds 16). A fast amateur
backbone can only cover about 150-500 miles in 5 hops, depending
on terrain. High hop count means high latency, and that kills
interactivity.

On amateur radio, the only practical way to get long haul hops is
on HF (GEO sats could eventually change that). And we can't get
very high throughput on HF (though we can certainly do lots better
than we're doing now). So forget about web browsing distant sites
via an amateur radio network.

Yeah, we need faster *local* nets to allow us to run better
applications than just interacting with a BBS. We don't
necessarily need faster backbones, however (though they
couldn't hurt). That's because fast backbones don't help
much with the real problem of distant realtime communications,
and that's an excessively high hop count which leads to
excessive latency.

Right now we have a chicken and egg problem. There aren't
any killer amateur applications which demand fast local nets,
and as long as there aren't any fast local nets, there's no
reason for anyone to write one.

We do use web browsers over 56 kb here locally, but to
access distant web sites we have to connect to the wired
internet's long haul links via a gateway since amateur
radio doesn't provide any (aside from some awful HF gateways).
Fast VHF+ backbones won't help much because the hop count
needed gets too high.

For non-realtime, where latency doesn't matter, fast
backbones can allow us to move a lot more traffic, and
that's good, but there's no real killer app requiring
that kind of backbone traffic either.

James,

I don't see a conflict of interest here. Many lawyers represent competing companies. In fact, you generally seek a lawyer with experience in your industry.

The lawyer can never divulge information about one client to another, so he can't recommend actions to either about the other unless one client asks him to talk to the other. There is no conflict of interest unless one of his clients decides to take legal action against another and asks his advice. At that point, most lawyers tell both of their clients to hire another lawyer to handle that legal action.

Conflict of interest means that he is breaching confidentiality or using knowledge of one client to benefit the other. Just the suspicion of this can cause his clients to leave. Proof gets him disbarred. No wonder he is pissed off.

73,

John

I've been involved in some SS projects in Australia.

Yes, you do need a license. About $35 AUD/year. Portions of the 915-928 MHz band are available, and 2400-2450 is also allocated. There is a plan submitted to allow full use of 2400-2483.5 MHz but under these conditions:

2400-2463 MHz 1 Watt ERP
2463-2483 0.1 Watt ERP

As ENG (TV news crews) use 2450 and up, there is some protection afforded to them. Right now, the power limit is 1W ERP on both bands, and there is also talk of allowing 4 Watts ERP in the future. The people at the SMA office in Melbourne (Southgate area) were very helpful.

Costs are coming down. In SS you pay for 2 things, speed and distance, also mutually exclusive. If you want MB rates, then 2-6 km is all you'll get. At ISDN rates, you are down to a more reasonable 20 km or so.

In article <4t7386$q6g@thepit.trucom.com> marty@trucom.com (Marty Albert) writes:
>NOS and its TCP/IP implimentation allows Packet Users to send mail
>DIRECTLY to each other without the need of the "store and forward"
>provided by the current crop of PBBS programs.

But it can do that *only* if there is a direct continous physical
set of links to the destination station. For traffic intended to
go outside the local area, that doesn't exist to the extent necessary,
and we must realize latency will be very high. In fact, store and
forward servers are just what we need to handle out of area Email.
That's especially true for long distance paths where the message
may have to wait for the vagaries of propagation to supply a path
for some of the links.

>This feature, like so many things, is a double edged sword and has
>both advantages and disadvantages...
>
>Some advantages are:
> (A) Faster contacts with others. That is, no need to wait a week
>for the message to drift through the maze of PBBSs to reach its
>destination, if it ever does.

But the physical network ultimately determines the speed and reach
of a direct connection. The reality is that when we get past a very
few hops, realtime throughput drops dramatically, no matter what
internetworking layer you're using on top of the physical networks.

> (B) Allows users to be an active part of the Network.

That's certainly a double edged sword. :-)

> (C) Encourages the development of multiple redundancy in a LAN.

Only if routing is *dynamic*. As long as NOS depends on static
routing, it is vulnerable to physical changes in the network's
topology.

> (D) Allows long distance keyboard to keyboard contact.

Not a chance. Too many hops means that realtime operation is
subject to intolerable latency. The internet deals with this
problem by having a mix of short range and longe range links
so that any end node is only a few hops from any other. The
amateur packet network doesn't have much in the way of long
range links (just some poorly functioning HF hops). So traffic
destined for outside the local area is going to face intolerable
latency delays if realtime connections are desired.

This is why the internet model isn't a good one for amateur
radio networks. Our trunks will have high latency due to the
many many relay hops, which each add a store and forward delay
equal to the packet length, required for distant connections
(at VHF+). So even if we switch the trunks to faster hardware,
we still will have horrible latency. The only way to lower
latency dramatically is to reduce the number of required hops
(or go to pure bit regenerator relays which have their own
problems for many step paths). But we don't have a way
in amateur radio to reduce the hop count except to use HF,
and our HF networks are currently dismal.

The model we can best implement is of a fast *local* net
connected by slower long distance nets which operate out
of realtime. Fortunately, this meets traffic patterns
fairly well. Most content is transferred between local
stations, and a lesser amount needs to go outside the
LAN.

> (E) The FTP functions offer a dramatic increase in file transfers
>over 7+, YAPP, etc..

Not really. Bits are bits, and it is the physical pipe that determines
how much you can cram through it.

>Some of the disadvantages include:
> (A) Few individuals will leave their station up 24 hours a day, 7
>days a week. This causes a breakdown of the Network.

>PBBS stations. These stations would stay on the air 7/24 and serve as
>POP and other Servers for the rest of their LAN. They could also
>handle the task of processing Bulletins and NTS messages.

And indeed they do. There's good reason to believe that POP and
NNTP servers (or better, broadcast servers) would be more useful
than the current crop of PBBS stations, but they still serve the
purpose of a PBBS.

>In practice, a Network User does NOT need all of the functions now in
>the NOS programs. A good analagy is the use of Dial-Up access to the

>stations that are a part of the routing chain. Only Nodes (analogous
>to an Internet router) and BBSs (analogous to an ISP) should be
>involved in the actual transfer of traffic.

That's the way the PBBS network works now. It is vulnerable when
one of those nodes or PBBSs is out of action. There is an advantage
to being able to use *any* station as a node. But the network
must be able to dynamically configure and heal itself for that
to be practical. As long as we depend on static configuration,
we're stuck with this problem.

TCP/IP is a good protocol stack, and we should use it, but it isn't
the solution to our problems. If we want internet-like performance,
we've got to get some long range links working to reduce the hop
count for distant interactive applications. And we need to concentrate
on increasing the speed of the *local* net, realizing that's where
the heaviest traffic load lies, and is where intensively interactive
applications requiring high network bandwidth are going to be done.

Since we can't achieve really high throughputs on HF (though we
can do *lots* better than we're doing now), we aren't going to
be able to browse distant sites like we do on the web. The hop
count is simply too high on the frequencies where we can achieve
high speeds, and the speeds are too low on the frequencies where
we can achieve long distance hops. We have to accept this, the
amateur network is not the internet, and the internet isn't a
good model for amateur networks.

Our real strengths lie in a different direction. And that's in the
ability to setup transient ad hoc networks to solve communications
problems, and in the ability to function when parts of the network
are down. To build on that strength, we need to develop self-configuring
and self-healing network software which can dynamically find a route
for our packets no matter what the current topology of the network.
That's much more important than all the GUIs in the world.

And we need to move the local user nets up to the fastest speed
we can manage without getting trapped by fixed paths which can't
be reconfigured on the fly. If we move the users up from 1200 baud
to 56 kb, we can handle 47 times as much traffic on the LAN, and
interactive applications can be much more complex, interesting,
and useful. Upgrading backbone speed doesn't buy us nearly as much,
because we start running into latency problems from too many hops.
The better solution there is to increase hop length, so that fewer
hops can be used, even if it means we have to accept a lesser speed
on the link.

The most useful wired analogy to amateur packet networks is an ethernet with a gateway machine connected to a telephone modem. Most of the traffic volume is local, so most of the speed and capacity are local, where the hop count is small. For out of LAN traffic, we use the gateway as a POP or NNTP server to batch our traffic to other gateways on other fast LANs. It isn't connected to them all the time, only when it has a batch of traffic to deliver. If we must have near realtime to distant locations, then we need to get the hop count down by using a HF bridge between the LANs.

HF paths are inherently dynamic, and for robustness against node failures, we want the rest of the network to be dynamic too, so we come back to my priority for dynamic configuration and self-healing in our network software. Our current NOS uses static routing tables which have to be managed by hand. That won't do.

Gary

Well, since you obviously decided to omit the authors of the various posts, you make it very hard to understand. I am responsible for that next-to-last paragraph, and as the poster before me brought up Part 15 and some non-existant regulation about "bypass", I was merely clarifying the point.

There are many in these newsgroups that fail (or just won't) see the difference between Amateur (Part 97) and Non-Amateur (Part 15) uses in the upper UHF 900 and 2400 MHz spectrum. This tends to confuse the poster - many of which (especially in the rec.radio.amateur.digital group) are not amateurs, but professionals just looking for information.

Their needs may be better served in the comp.std.wireless group, but for some reason, here is where they end up, having a number of people with their "you can't do that" messages quoting (and mis-quoting) Part 97 even though the poster had no reference or intention of using the Amateur bands in the beginning (or those that don't even bother to read the header, and the poster was operating in another regulatory environment to begin with).

4009. Run FBB under OS/2 with IO-driver "SIO" (VX00.SYS) - how ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-28 00:00:00 UTC
From: fredrik.elversson@mailbox.swipnet.se
Message-ID: <4tffvd$619@mn5.swip.net>
Source record: 35506

Hi,

I want to run FBB under OS/2 with the program "SIO" as the IO-driver
for my TF-prom in hostmode. I have been told to use the
"VX00.SYS"-driver in the configuration and write it in at the
"DEVICE-DRIVER" (I think it was?) . I have done this, but FBB only
complains about "ESS not loaded for COM2".

I have a friend here in Sweden who told me all this, (he runs it with
no problems). But I can't get it working.....

Does someone have any clue what might be wrong?

Please also E-mail if you reply - so I won't miss you answer! hi.

Many 73's de Fred SM7UGE

What I have seen was just a slicer (use any OPAMP or comparator) that
outputs the data on the CTS pin of RS232 (pin 5 on 25-pin connector).

4012. Linux ax.25 Setup Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-28 00:00:00 UTC
From: Greg Corteville <cortevi5@pilot.msu.edu>
Message-ID: <31FC036E.6E98@pilot.msu.edu>
Source record: 35509

I'm trying to set up ax.25 support on my Linux box and am running into a few snags. I've compiled support into kernel 2.0.8 and am using the 2.0.0 ax25 utilities. After carefully following the instructions presented in the ax25-howto, I attached the device using the "axattach /dev/ttyS0 radio" command. The system reports that device sl0 has been successfully set up. But when I go to test my connection using call, the system just sits there "Trying..." and does not key up my radio at all. "mheard" produces only the first header line of what would probably have been a list of stations heard. The TNC reports heard stations in terminal mode, so I know there are some there. The "listen" command just sits there even when I know the TNC is picking up packets.

My TNC is a Kantronics KPC-3. I put it into KISS mode using Minicom by entering the "intface kiss" command and then issuing a reset. So what am I missing here?

>program the first half to transmit silence.....with the 2nd half of the
>eprom containing the normal TX waveform data. A single FET (switched by
>the PTT line) is then used to switch in the relevant half of the eprom.

The problem "the transmit audio is also present while receiving" is
not the difficult problem here. Indeed that is easily overcome by
switching it off somehow. I have also used 4066 switches for this
purpose, one can be easily inserted in the original G3RUH design for
this purpose.

However, that does not make the transceiver suitable for 9600 bps!
It still has very poor LF-response due to the modulation inside the
PLL loop. Also, the keyup response time is poor.
These are limitations of the design, and cannot be fixed.

>I totally agree with Joop about the '9600bd ready' adverts being
>misleading. I have yet to come across a single one of those rigs that I
>would call 'ready'.

The really bad thing is that they not only aren't "ready", but they
never will be. So, by buying such a box you are just throwing away
your money. Funny indeed, that the US legal system allows such claims
to be made in advertisements, while at the same time you will find
any food or household equipment box printed with warning texts all over.

>9600 baud, but I won't do it if it won't work on 1200 baud
>packet also.

It isn't a dumb question. There is a small problem.
1200 baud is normally done through the microphone
and speaker connections to the radio. As such, it
uses the radio's pre-emphasis and de-emphasis circuits.
When you modify the radio to connect directly to the
modulator and demodulator, you bypass these emphasis
circuits. The result if you try to use those same
connections for 1200 baud is a defect called "tone
twist".

Tone twist will result in the high tone having less
than expected deviation on transmit, and the low
tone having less than expected amplitude on receive.
This can cause some problems with other stations
because their modem will either have trouble decoding
your signals or your modem will have trouble decoding
their signals.

Tone twist isn't usually a serious problem, but if
it does cause trouble you can add pre-emphasis and
de-emphasis RC networks to the 1200 baud port of
the modem to straighten out the twist. Usually,
however, you'd just continue to use the microphone
and speaker connections of the radio for 1200 baud
while using your new direct port for 9600 baud, so
this problem shouldn't arise.

Marty Albert (marty@trucom.com) wrote:

[Interesting info about the future of PBBS's snipped]

I agree with a lot of what you posted, but I do have one question. Why limit the long-haul to HF? I have sent a number of messages through our local SATGATE and the messages propogated quickly and far. Sure, they aren't Internet speeds, but it worked, and it worked well.

OK, I admit that I may not have all the facts, but it seems to me that if you have a choice between HF 300 baud in bad propogation conditions vs. 1200 or 9600 baud satallite transmission, the choice is clear. When the HF bands open up, things may change, but I think we have a pretty good alternative.

As far as the Internet goes for transport, it is nice that it is available, but to me, it should be a resourse, not a transport. I like being able to access resources on the Net, but for the actual transport, I personally think that we need to come up with a more reliable (than current HF for long haul) wireless method. Think about it. If the phone systems go down, the Net is dead for most people. If Packet relies on the Net, then it too goes down. Current wireless Packet LANs (Internet pipes not included) run completely independent of the phone system.

4023. Digital Microwave Radio - 1200bps stinks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-29 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10751@wb9mjn.ampr.org>
Source record: 35519

Hi Will,

Well, Yea, that s an advantage and a disadvantage to the WA4DSY modem. Its easy to get on bands where 30 Mhz is a useable first IF, but expensive higher up. With the availability of radio parts to do I/Q radios up to 2.5 Ghz, these days, I think the DSY modem needs to have an I/Q output to allow for cheap migration to other bands.

Oops, make that I/Q interface.

Hi Gary,

9600 being narrower bandwidth allows for more access channels. For access usage, there s not that big an advantage to 56 KB. If the traffic builds, one puts on more access radios, and links. In the end, one has just as much bandwidth at 9600, then 56 KB, with individual costs about the same. Assuming the individuals help pay for the network.

The advantage of point to point links, is they allow for spectrum reuse in small areas.

No, the reciever does not need to be omni. I went into this further down the my posting. But, let me re-explain. With an electronic scanning antenna, an inactive station can scan continuously. Nothing better for it to do, right? If it hears a data carrier from another station, it can then respond. And, if the other station has traffic for the first, it can start the exchange. If not, the other station can send a NAK. Voil'a, a versatile, yet point to point radio system. A scanning antenna has omni coverage, but not simultaneous omni coverage.

Some say a radio modified for 9600 is a better 1200 baud radio than an unmodified radio. Yes, it works both ways just dandy.

> The above question may seem like a dumb question but I really
> don't know. I am considering modifiying my DR-1220T for

> packet also.

Depends on how you modify it. Afterwards it might not be voice capable. Is this a DR-1220T, or is it really a DR-1200T? I'm not familiar with the DR-1220T.

I am familiar with the DR-1200T and can positively recommend against it as a 9600 baud radio. I have one, came as a matched pair with a DRSI DPK-9600 TNC, mod was performed by DRSI. While this radio works at 9600 it is slow to key. This past week I conducted some tests on the bench with my DR-1200T, an Icom IC-820H, and a VHF Mitrek. Any two radios receive the other equally fast. Triggering on PTT the Mitrek put a pretty signal on both the Icom and Alinco in under 1 ms. The Icom could put a similar signal on the Mitrek and Alinco in 18 to 20 ms. The Alinco wasn't heard by the Mitrek or Icom for 150 ms, plus there was another 50 ms period or so while the Alinco's frequency was still settling. I've always noticed we couldn't get the Alinco's TXDelay under 280 ms but never knew if it was the transmitter or the receiver. What I haven't tested yet is how long the receiver in these radios take to recover after transmitting. Whatever that test produces the Alinco's performance is already too poor for me to be happy with, but I knew that before I proved it.

Go find a good clean Mitrek. They run from $20 to $70 or more. Figure $50 to $70 to recrystal (pay the pros to temperature compensate your channel elements, its worth the $15/each). Make sure your Mitrek comes with channel elements (one for Tx, one for Rx) and you really want the proper connector for connecting power and signals. If you don't get a service manual with the radio they can be had via 800 number and credit card from Motorola for $15. The Mitrek can be tuned with only a signal generator (maybe an HT?) and a voltmeter. A frequency counter would be useful to set the transmit frequency.

Am sure most of what I've said about Mitreks also applies to GE
Master series, and Motorola Micor. Its just that I have several
Mitreks and have been very pleased.

73,

Message-ID: <4thkqe$btt@thepit.trucom.com>
Source record: 35526

Hello Again:

This issue is a rather emotionally charged one and I exepect to get a
few flames on this one...

> PBBS STATIONS ARE ON THE WAY OUT
> (3) Increased use of Internet and other wire-based networks for forwarding traffic has
decreased the
> need for radio networks.

While there are a number of very vocal people out there, especially on
Packet, that are opposed to the practice of transfering traffic via
Internet or wire (you know the ones... They call everyone else names
like "Land Line Lids"), most have few, if any, facts and are talking
from an emotional position.

Be that as it may, I see this issue as having two parts: (1) Why is
the Internet being used to forward Packet traffic? and (2) What can be
done to move the the traffic back to Packet?

Let's look at each...

(1) Why is the Internet being used for Packet Traffic?

The answer to this is very simple... Because the Packet system,
especially long haul routes, are seriously broken and don't work. I
have done tests and found the following average transit times for
messages originated from my location in SE Missouri:

TO DAYS
US East Coast ------- 3
US West Coast ------ 4
England --------------- 8
Russia ---------------- 12
Japan ----------------- 5
Chile ------------------ 16
Alaska ---------------- 5

Note this was PRIVATE MAIL and so should have received top priority on
the network. Bulletins take even longer to propagate.

Why does it take so long? There seems to be several possible answers
to this question:

A) The HF bands are down and it takes a long time to transfer the
messages. This is actually related to B below. See there...

B) There aren't enough HF forwarding stations so the individual paths are too long. If there were enough HF stations to reduce the path length, this problem and problem A above would both go away.

C) Some HF forwarders make judgement calls as to what to forward and what not to forward. I have found that about 18% of all private messages sent via radio NEVER get to their destination. Most can be traced to 4 or 5 particular HF stations.

D) It is expensive to set up an HF station.

E) It is hard to run an HF station.

F) Why bother? The Internet is easier.

(2) What Can Be Done To Move The Traffic Back To Packet?

We need to look at the problems above and solve each:

A) Until we can learn to control the sun, this will be a problem that eludes a solution.

B) Get more HF stations on the air. See below...

C) A SysOp, no matter what band, has an ethical and moral obligation to pass all legal traffic. The lines about "It's my station and I'll do what I want" smack of the same comments made back in the early days of LL BBS networking. You have the duty to stop traffic that does not comply with the various rules, but you have an obligation to pass all other traffic. Note that I am NOT saying that you HAVE to pass all other traffic (there are no laws that say you must) but there are ethical and moral issues to look at.

D) No arguement here! By the time you buy the radio, suitable TNC, antenna, amplifier, etc., you will have a sizable investment. Recall, however, that the more items a manufacturer sells, the cheaper the item is likely to get... More HF stations will drive down prices. Also, for the purists, what is wrong with homebrew designs?

E) Again, no arguement. The biggest problem is archaic rules that don't allow unattended, automatic forwarding on a wide scale basis and the opposition to this by a few very vocal groups. The rules MUST be changed before anything will happen.

F) Good question! Perhaps so good that it deserves additional discussion. Again, there are a number of purists that would like to see all Internet forwarding of Packet traffic to end. While this may be ideal, it is not practical. There are several statements offered and each has flaws, some serious, some meaningless, some in the gray zone...

(1) IF EVERYONE STOPS INTERNET FORWARDING, THE PACKET NETWORK WILL SURVIVE. In a word, bull. If it takes a week or more to move traffic from one continent to another, no one will use the network.

(2) IF WE DON'T STOP USING THE INTERNET, THE NETWORK WILL DIE.
Maybe, maybe not. Personally, I belive that Internet forwarding WILL decrease the need and use of the Packet network. But until the Packet network's problems are fixed, no one now using Internet will switch back and more will switch the Internet.

(3) IF YOU DON'T USE 100% RADIO, YOU ARE LAND LINE LID. Name calling and rediculous demands have always solved problems, haven't they? Look how it helped Sadam...

(4) THE PACKET NETWORK WILL NEVER COMPETE WITH THE INTERNET. Why not? It has been shown that T1 plus speeds are more than possible. Instead of name calling, whining, and infighting, why not actually DO something?

Well, that's enough for now. Again, I expect that I will catch a few flames on this topic, but it won't be the first time nor will it be the last.

All I ask is that you post your comments, no matter if pro, con, or otherwise, to the News Group for all to read and offer input.

One disclaimer... Note that if you send me E-Mail on this subject without posting to the Group, I WILL POST YOU MAIL HERE. There is, as far as I am concern, no private discussion on this topic.

4031. Terminal Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-30 00:00:00 UTC
From: jw@usbbs.com
Message-ID: <4tjvkt$rii@news.netusa.net>
Source record: 35527

I just purchased a PK96.. I also purchased the AEA Windows software..

I realize terminal software is a religious thing, but are there any
other choices of packages that support the PK-96??

Also, while you are reading.. I just connected my LAN in the house
here to the Internet.. Any BSD unix programs out there that support
TNC's ?

I realize the answer for Linux would be much different..

4032. Gunneplexors

>
>Some say a radio modified for 9600 is a better 1200 baud radio than
>an unmodified radio. Yes, it works both ways just dandy.

This is demonstrably untrue. A radio modified for 9600 *should*
have a flat frequency response - i.e., the frequency deviation
should be the same for a given level regardless of frequency.
1200 baud, which is sent as an audio signal, *should* have
the standard 6db/octave pre-emphasis, which means a 2KHz tone
should produce twice the deviation that a 1KHz tone of the
same level.

Now, if you're building a point-to-point link with radios set
up together, it wouldn't actually matter, but 1200 baud radios
do, by convention, use the 'standard' PM type pre-emphasis. In
other words, a PM radio (a phase modulated radio) inherently
produces a 6db/octave pre-emphasis, and all FM/PM radios include
a 6db/octave de-emphasis network (if they don't, they're broken).
If you want even a chance of inter-operating with the rest of the
1200 baud community, use pre-emphasis or a PM radio. Of course,
you can add a pre-emphasis network to a direct-FM radio to
get the same result.

[...]

>Am sure most of what I've said about Mitreks also applies to GE
>Master series, and Motorola Micor. Its just that I have several
>Mitreks and have been very pleased.

Hold on! Not all Motorola Micor radios are created equal, as well
as Mastr (note the missing vowel). Some Micor mobiles are direct-FM,
but most of the VHF mobiles are PM and inherently unusable as 9600
baud radios. All Micor repeaters (actual repeaters, not converted
mobiles) are direct-FM. All UHF Micor mobiles are direct-FM, too.

I don't Mastrs as well, but, again, most mobiles are PM and can't
be used as 9600 baud radios.

If you want a 9600 baud radio, find a rock-bound, direct-FM radio
and go from there. Few synth radios are suitable - but there are
some.

Source record: 35533

Due to that the directions are kind of complicated we will be monitoring
146.550 simplex.
Also you can call Arnie at 714 - 573 - 2965

SCDXC Summer Bash

The annual summer bash sponsored be the Southern California DX Club will be
held on Sunday, August 4th from 11:00 AM to 5:00 PM at the QTH of Arnie
N6HC.
This is a sort of open house Arnie and the SCDXC welcome all Dxer's,
Contesters etc. etc.
All you have to bring is a good appetite and some good stories.
Directions as follow:
Take either the 5 or 405 freeway to the 22 freeway East, then the 55
freeway North and exit at Chapman Avenue East.
Follow Chapman East approximately 2 miles to Crawford Canyon and turn right
onto Crawford Canyon.
Go to the end of Crawford Canyon to Newport Blvd. and turn left onto
Newport Blvd.
Turn right onto Cowan Heights Blvd. (first traffic signal).
Follow Cowan Heights to Skyline (first right) and turn right onto Skyline.
Continue on Skyline about 0.5 miles to Hunting Horn Drive and turn right
onto Hunting Horn Drive.
You will see the antennas. Again all Dxer's and contesters etc. are welcome
and see you all August 4th .

Arnie Shatz, N6HC
10931 Hunting Horn Drive
Santa Ana Ca

For more information you can send me a e-mail:

4039. help! dsp-based PC soundcard with Analog Devices chipset

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-30 00:00:00 UTC
From: hill@rowland.org
Message-ID: <4tlqet$326@shore.shore.net>
Source record: 35535

I'm still looking for pc soundcards using the Analog Devices PSS (personal sound system) chipset (AD-2115 dsp with ram, AD1848 soundport, and the ECHO asic ESC614A). I think it's the best way to solve my problem: On July 12, I asked:

1) Are there any sound cards with DSP chips which can do modest "real-time" FFTs, say 512 or 1024 samples, once a second, etc. or even slower, without loading down the main CPU? The results of the FFT should be displayable in a window. Sounds real useful - anything available?

2) What's a good sound card with a DSP and a good library of C routines and compiler to make use of said chip?

3) Anybody try DC-coupling the sound card A/D input stage or at least paralleling a much larger coupling capacitor for reponse down to 0.5Hz etc? As you can guess, I want to do some simple vibration monitoring!

The Analog Devices website says Cardinal, Adaptec, Orchid, Media Devices, Western Digital, and other make PSS soundcards. But I can't confirm that - I suspect these companies did make them (and like Cardinal, stopped) or meant to make them (and didn't). They also mention Wearnes Technology (who are they?).

Can anyone make any suggestions? I do know quite a few hams and radio shortwave listeners have worked with these cards and the DSP to make realtime audio filters in their computers.

Anybody want to sell some old Cardinal or Media Devices boards?

>hire another lawyer to handle that legal action.

I don't know where you get your information, but it is both uninformed and incorrect. The ABA Model Rules of Professional Conduct Sections 2.0-2.2 makes it quite clear that if two clients are adverse in an action, the lawyer cannot represent either, unless one gives the lawyer permission to represent the other.

>Conflict of interest means that he is breaching confidentiality or using
>knowledge of one client to benefit the other.

No, that's not what it means. It means that the lawyer cannot diligently represent one client without failing to diligenly represent the other. (My words, but that's the gist of it.)

>Just the suspicion of this
>can cause his clients to leave. Proof gets him disbarred. No wonder he is
>pissed off.

Wrong again. Disbarment is not always the sanction imposed on a lawyer who violates the rules. Sanctions usually are less severe, such as a public reprimand, or other punitive, non-disbarment stuff.

>reference or intention of using the Amateur bands in the beginning (or those that

Maybe 'we' should react more offensively against people who post clearly
non-amateur requests (like 'I want to have radio access to the Internet,
how can I do that') on this group. The group is focussing on amateur
radio homebrewing or digital transmission techniques, not on NCR Wavelan.

4046. RE: Digital Microwave Radio - 1200bps stinks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-30 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10762@wb9mjn.ampr.org>
Source record: 35542

Hi Jeff,

Well, there are other technologies besides phased arrays, and other technigues of phasing that are cheaper, as well. But, I wont go into this, its beyond the scope of this news group.

I m not thinking of a "Hub'd" type system. I think an infrastructureless technigue would be better. One does not need the hub, to have a network. Two guys can start up, using the same hardware boxes. Then more can join in, and the resource will be fully utilised, minimising overloading. I don t like token passing in radio networks. I think asynchronous aquisition could be done with full duplex radios, or slotted acquisition with simplex radios and a time standard (such as the W3IWI Totally Accurate Clock).

Central High point radios would waste allot of area, in the resource which is the product of Time, Bandwidth, and Area. But, they may be called for to bridge areas of sparce participation.

Yes, I think each station, can have a steerable array. And thus do away with a hub style network.

73, Don.

I have not tried it myself, but others say this can't be done. The
gunn cannot be modulated fast enough (at least not by modulating the
supply voltage).
The N6GN design that uses gunnplexors has a datarate of 2Mbit/s.

I've got two Cardinal cards, in my PCs at home and at work, and am very pleased with them. Most of the manufacturers you mention stopped making them some time ago, primarily because of the very cheap conventional sound cards that are now available.

I believe that Echo might still be making the things. A colleague of mine bought one from them when they became hard to get from the other manufacturers. I vaguely remember seeing somewhere that they were bringing out a new version using the ADSP-2181, as used on the ADI EZ-Kit Lite.

Free development software is available for these cards, as you probably
know. Assembly language only, though.

4051. Digital Comparisons

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-07-31 00:00:00 UTC
From: Phil Sussman <pactor@pactor.com>
Message-ID: <320026C3.60BD@pactor.com>
Source record: 35403
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.digital.misc

Greetings,

Recently I received some E-mail regarding my article about PACTOR
Comparisons, which appeared in "Packet Perspectives" in May QST.
Since only about 1/3 of my text found its way into print, a short
clarification may be in order.

My intent was to explain that all 'PACTOR-1' is NOT the same.
Some TNCs operate PACTOR-1 far better than others, because
some units adhere to the original specifications and others don't.
Comparisons based on 'poorly performing' PACTOR-1 protocol may be
flawed. I was NOT being critical of any OTHER mode.

In July QST, "Digital Mode Comparisons" arrived at the same conclusion.
Not all PACTOR-1 modems have the same performance. They were shown as
PACTOR-1 "A" and PACTOR-1 "B". I did not write or contribute to that
article. Those authors created and published their own work.

However, some explanations were confusing and results were NOT
displayed uniformly. For example, CLOVER results in CCIR-Poor
were distorted by a test procedure.

I have gathered comments, corrections, etc, from other hams.
Some of us have been collectively working on a reply article
which seeks to better explain the results. We also re-graphed
the QST data and plotted ALL modes, for given conditions, ON
THE SAME SCALED GRAPH(s).

For more details, see: http://www.pactor.com

>73 de Wald VE3PEX

Find some back issues of 73 magazine. There is an article written up on
using the mac and a simple modem that can be made. They give and address
where the parts can be obtained.

If you go with a regular TNC I would suggest one of the Kantronics models.
I use a KPC 9612 connected to a powerbook 145B and the Hostmaster Mac
software. I had a PK 232 and the MacRatt software and It would lock up on
me most of the time. The software was designed for system 6 and AEA didn't
have any plans on upgrading it when I last called them about a year and a
half ago.

For TCP/IP I use NetMac which is the only product avialable for the mac.
The latest version of it is at ftp.ucsd.edu. It's in the TCPIP/incoming
directory. You will also need the netmac environment to go along with it.
These are the support files. IMMac is the SMTP mailer program that is used
in conjunction with NetMac. The latest version of NetMac is 2.3.60. All
the tcpip is probably over the head of someone just starting out in packet
though. If they are going to get into tcpip they should get the NOSintro
book by Ian Wade. It is written mostly for PC users but it helped me
understand how to get going. I had to read it a couple of times to get the
hang of using a text only mode. I've had a mac since 87 and was used to
point and click.

Mastr II's are normally phase modulated, however, using them on 9k6 packet is simply a matter of modulating the oscillator in the transmit channel element. The built in variactor diode for temperature compensation acts as the modulator.

> a perfect candidate for a TNC emulation...

Yup. The Mac uses an 8530 for its serial ports, just what you need *not* to have to bit-bang every bit as the Genuine PC Baycom does. While there was some word a year or so ago where somebody was working on a full TNC driver for the Mac's serial ports and Baycom-esque modems, I've not heard anything since. Meanwhile start at:

ftp.ucsd.edu:/hamradio/packet/tcpip/mac

You need:
softkiss.1.8.sit.hqx (this is the driver, emulates a KISS TNC)
IM_Mac1.0b28f.sea.hqx (mailer for Net)
NET_Mac2.3.54.sea.hqx (Net binary)
NET_Mac-environment.hqx (basic folders heirarchy needed for Net)

Often there are newer versions of the above in
ftp.ucsd.edu:/hamradio/packet/tcpip/incoming.

Notice this means you need to run a Net/Nos system to use a cheap modem for packet on a Mac. Am not sure its worth the effort if "cheap" is the plan. But its a worthwhile thing to jump in and play with if you want to get your hands dirty, smell burning solder flux, and tweak computer bits.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc

Does anyone know how many dB of loss mirrored office tower glass
windows have at 900 MHz? Or where I could look it up?

Cell phones work inside the building, so it couldn't be too bad.

I'm guessing between 5 to 10 dB.

From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <PRukiAAsDx$xEw11@peaksys.demon.co.uk>
Source record: 35545

I'm looking for a home wx station to use on a node. I'm familiar with the Davis equipment, but the need for the Weatherlink (expensive over here!), and the fact that you have to poll it for information, makes it less than ideal for my application.

Is there anything else available in the USA that meets these requirments:-

1. Cheap!
2. Sends its data, without being polled, every 5 or 10 seconds.

Exactly. Also, there is no reason for the sats to be limited to
anything less than T1 speeds.

Overall, I agree. Just off the cuff, I would see some sort of
"layered" routing based on priority of the message... For high
priority, we use the fastest route available at that time. For low
priority, we use fastest radio only route.

It depends on what they mirrored the glass with and how conductive it is. I ran in to the same problems about five years ago when the office building they were building at work had that kind of glass.

We experimented at 23 GHz (one of the many microwave links to and from this building) and discovered an atteunation of about 10 dB. We decided to do things the right way and erect a radome window on the penthouse. It works pretty well.

On July 5th, we moved to our own domain name at www.hamradio-online.com.
Unfortunately, the company we rented server space from announced on July 13th
they are leaving the web hosting business. Thanks to California Wireless, Inc.,
we have moved Ham Radio Online to their server which you can access for now
using this IP address:

http://206.13.40.11/

We are working to get the www.hamradio-online.com domain name redirected to the
new web site. In the interim, please use the IP address shown above. The new
web server is located in California's Silicon Valley so west coast readers
should see relatively good performance.

We also have begun adding August articles.

Flags or square waves depending on TNC type and settings.

In my own experience, using CLOVER on 20 and 40 M only,
it is possible to handle all presented personal traffic
with minimal (5 minute to a few hours) delay. The main
problem is that there are too few stations on air.

I also forward most bulletins to wb1dsw directly. Delay times
can be several days, but the usual delay is a few hours.

> B) Get more HF stations on the air. See below...

Yes. We need MANY more dedicated full time store and forward
systems using modern protocols (e.g. clover, pactor-II).

> C) A SysOp, no matter what band, has an ethical and moral obligation

> other traffic (there are no laws that say you must) but there are
> ethical and moral issues to look at.

Any sysop who does not handle *every* presented personal message
should shut his system down.

> D) No arguement here! By the time you buy the radio, suitable TNC,
> antenna, amplifier, etc., you will have a sizable investment. Recall,
> however, that the more items a manufacturer sells, the cheaper the
> item is likely to get... More HF stations will drive down prices.
> Also, for the purists, what is wrong with homebrew designs?

Many sysops already have HF stations capable of handling sizable
amounts of traffic. My 40M CLOVER station consists of a 12 year
old TS-930 and a dipole. Not a big investment.

> E) Again, no arguement. The biggest problem is archaic rules that
> don't allow unattended, automatic forwarding on a wide scale basis and
> the opposition to this by a few very vocal groups. The rules MUST be
> changed before anything will happen.

Unattended automatic operation is allowed within specific subbands,
at least when operating under FCC rules. There is no restriction
on who may take part in this mode of operation. i.e. the old STA
is long since gone, and auto/unattend is now legal in the US.

> F) Good question! Perhaps so good that it deserves additional
> discussion. Again, there are a number of purists that would like to
> see all Internet forwarding of Packet traffic to end. While this may
> be ideal, it is not practical. There are several statements offered
> and each has flaws, some serious, some meaningless, some in the gray
> zone...

Just for the record: I am *NOT* one of those "purists".
My position has always been "Use radio where available."
Those I call "Land Line Lids" are BYPASSING WORKING RADIO LINKS.
I have no problem with using the internet (or diskettes by mail)
as a means to move data WHERE NO RADIO LINK EXISTS. I've done it.
In fact, doing so is a good means to help get the radio links built.

> (1) IF EVERYONE STOPS INTERNET FORWARDING, THE PACKET NETWORK WILL
> SURVIVE. In a word, bull. If it takes a week or more to move traffic
> from one continent to another, no one will use the network.

Here we have a problem. If we do NOT turn off the internet links,
nobody is going to spend the money to build a station with overseas
capability. A satellite system or "big gun" HF system is NOT cheap.
Why don't I forward with Asia and the Pacific? Because doing so
would take another several thousand $ of gear, and there would be no
traffic for me to handle - it is being forwarded over the internet.
If there WAS no internet forwarding, then I *would* spend the money
and put up the big antenna and buy the amplifier and start forwarding
with stations across the Pacific. I know at least three other hams
in the Pacific NW that would do the same - IF the traffic was there.

> (2) IF WE DON'T STOP USING THE INTERNET, THE NETWORK WILL DIE.
> Maybe, maybe not. Personally, I belive that Internet forwarding WILL

> decrease the need and use of the Packet network. But until the Packet
> network's problems are fixed, no one now using Internet will switch
> back and more will switch the Internet.

You forgot the key words: "to bypass existing radio links and
to preempt traffic from them". This is why the radio links are dying.

> (3) IF YOU DON'T USE 100% RADIO, YOU ARE LAND LINE LID. Name
> calling and rediculous demands have always solved problems, haven't
> they? Look how it helped Sadam...

Ok, pick another name. I'll continue to call them lids.

> (4) THE PACKET NETWORK WILL NEVER COMPETE WITH THE INTERNET. Why
> not? It has been shown that T1 plus speeds are more than possible.
> Instead of name calling, whining, and infighting, why not actually DO
> something?

Do what? The traffic is not there, it has already been taken away
from the radio links. How can we get that traffic back onto radio?
What actions do you suggest to get those sysops who BYPASS radio links
to STOP DOING IT and let radio handle the traffic? I'm not talking
about links with "3 days delay" but 9600 buad point to point links
where we forward on a five minute cycle (average 2.5 minute delay
per BBS hop). We have folks who bypass THOSE links via the internet.

> Well, that's enough for now. Again, I expect that I will catch a few
> flames on this topic, but it won't be the first time nor will it be
> the last.

Please suggest a name for the folks who are doing what I describe.
I coined the term "Land Line Lid" to describe them. K7IQI suggested
"Amateur Internet Provider". I've heard many other terms used.
Derogatory? Yes, and intentionally so. We are talking about hams
to choose to use the telephone IN PREFERENCE to EXISTING WORKING
RADIO LINKS. We are NOT talking about hams who use non-amateur
means to provide temporary connectivity where radio connectivity
does not exist or is impossible to provide.

> All I ask is that you post your comments, no matter if pro, con, or
> otherwise, to the News Group for all to read and offer input.

I'll say it again: please take this discussion over to the RADIO
network so that everyone can take part.

> One disclaimer... Note that if you send me E-Mail on this subject
> without posting to the Group, I WILL POST YOU MAIL HERE. There is, as
> far as I am concern, no private discussion on this topic.

Thank you!

I believe that keeping the discussion fully open and public is very
important.

: I'm guessing between 5 to 10 dB.

I'm sure it depends on what kind of mirroring material you have. But
I can share one experience I had though with a pull-down mylar sun shade
on an office window.

With a midsized yagi set up inside the building and line-of-sight to a
hilltop radio at 904 MHz I couldn't figure out why signals were so weak
(~30 dB down from LOS values) and the antenna peak seemed poor and in
the wrong direction. Finally I realized that the shade was down and
pulled it up. Doing so restored the signal strength and made the
antenna pattern look correct once more.

It was a pretty dramatic difference.

I'm brand new to packet radio. I put up a BayPak BP-2M with my
Radio Shack HTX-202. This seems to be working (sort of) on 2 meters,
but I see that my station is sending many rejects and so it takes a
very long time to transfer messages. The data is coming in S9.
d I'm using the BayCom 1.40 software that came in the package. What
(if anything) can I try to adjust to improve this? Thanks in advance.
73,
Jerry, AA2ZY
Well Jerry, not too familiar with your baycom. (Im still using the

MFJ 1171. and Digicom 128 V5. But in AX.25 packet if you are just
starting dont wanna insult you by stuff that is obvious. Try adjusting
the timing for followins params TXDELAY (try set to 40) AXHANG (try
moving it up or down in timing) RESPTIME (try playing with nrs on this
too Usually 0 is okay but you can make it wait up to 16 with no problem.
Maxframes (set to 7) PACLEN (set to 255). The above applies if you
have an excellent signal patch to the one your transferring msg tfc to.
If you dont then narrow down the PACLEN to 64 or 128. TXDELAY can be
adjusted upward to 80 with no problem except slows things down little.
AXHANG also the larger the # the slower it gets but sometimes must be
done if your going through a digipeater thats slow keying.
Hope the above helps. Keep your original params by saving them
to disk or into the TNC memory before playing around so you can always
go back to them later as a return point.

I had to set up a temporary 900 mhz wavelan system in an office window
while we waited for them to finish building the roof and give us access
to it, and it also had the 'low E' glass on it.

I found I could put a corner reflector in the room, spaced off the glass,
and get usable signals through it. But it took a lot of fiddling. We had
to experiment with how far off the glass to space it (so the reflections
nulled I assume) and then mount the whole thing with homebrewed hacked up
styrofoam spacers and duct tape to hold the antenna 'just so'. Then we
found if you walked around the room, the reflections out the side of the
corner reflector bounced off you and back in and messed things up, but
some aluminum foil on the open sides (and more duct tape) cured that.
Pretty *ugly*, but it worked until we could do the proper install on the
roof.

Attenutation wise, I'd guess 10 db also, we were running over a 1.5 mile
path on gear rated for 3 miles so it couldn't have been too high.

Like they said on the duct tape commercial on PHC last week..."Duct tape.
When you can't get the job done right, get the job done. " :-)

If you go to 24ghz you shouldn't have any trouble at all with 10meg, if that's
what you really need. Gunnplexers and cheap gunn heads are available for 24 too.

This is my first reply to a news group. What does this have to do with DX. I have been reading the rec.radio.amateur.dx stuff for about a week now and notice little DX info is reported here. Is this intended to be a source for DX? If not let me know so I can stop wasting my time. de Bernie, WR3E.

I wonder what test procedure you used to measure the Mitrek time delay. I presume that you monitored the Mitrek on a nearby receiver with a triggered sweep scope. That would be a valid test for freq stabilization but according to the Motorola Mitrek service manual, the mitrek output circuit has a deliberate 15 ms time delay in power output to allow the output reed relay to switch before the power came up. Sensing the RF power output with a power detector > triggered scope would be a better test for checking the signal that stations more than a few hundred feet away would hear. Both test procedures are necessary.

> The Icom could put a similar signal on the Mitrek and Alinco in 18 to
> 20 ms.

That was only because the Icom was a multimode rig with freq generation using mixing. Icom FM only radios have a typical turnon time of 100 ms plus stabilization time above that.

Which points out that a set of standardized test procedures for data radios are necessary if we are to be able to compare tests performed in different locations by different people. Such a set of procedures does exist but has not been widely distributed yet. Look for the DRSTM (Date Radio Standard Test Methods) web site to be announced in about a week or two). Just as soon as I can get the last of the procedures converted to

html.

Daves's comments can also apply to the Motorola MAXAR , MAXAR 80 and Moxy series. They key up and stabilize in 600 microseconds max and the receiver recovers in 5-7 milliseconds (except for the squelch which smart packeteers don't use anyway :-)). These radios have full electronic RF output switching, have similar circuits to the Mitrek and can be had on the surplus market from 15$ up. I use them on most of my backbone circuits. Like the Mitrek, they are direct FM.

One problem with 9600 however is the relatively large modulation coupling capacitor used with the G3RUH modem. The time constant on the capacitor can be 50+ ms and this can limit the minimum freq stabilization time in radios adopted to that modem.

There is a BayCom driver for the Mac. It is called: SOFTKISS and is
"freeware". It can be found at several sites here on the net, as well
as compuserve and the telephone bbs's.

4082. Russian Space IP Opportunity

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-02 00:00:00 UTC
From: glenne@sr.hp.com
Message-ID: <4ttfam$t8s@canyon.sr.hp.com>
Source record: 35428

Recently Karen, RA3APW, and Leo, UA3CR, were invited by Serge Krikalev, U5MIR, and Serge Samburov, RV3DR, to visit the Russian Space Control Center. U5MIR is currently the deputy chief of Russian space flights and RV3DR is the manager of the Russian space amateur radio program. They were able to have a long talk about future amateur experiments in space, particularly relating to digital radio networking.

Karen brought up the possibility of marrying the existing PACSAT protocols and hardware with amateur TCP/IP networking protocols. He suggested that if this combination were put into place on the oribiter and also at amateur Internet/satellite gateways around the world, perhaps one in each time zone, it could be possible to maintain fulltime IP connectivity with the orbiting MIR.

In addition to offering continuous IP access to MIR from anywhere in the amateur world, such an experiment might be useful for discovering and developing necessary protocols for mobile IP operation; an area where amateurs might have considerable interest and one where we may be able to contribute significantly to the state of the art. Because much, if not all, of the required hardware is already in use, the bulk of the initial task would seem to be in adapting software to allow running IP over PACSAT.

Karen and other Russian amateurs are interested in this project. U5MIR and RV3DR, are supportive of the concept and there would be licensed amateurs aboard the spacecraft. U5MIR is scheduled to be on board the next generation of spacecraft, the ALPHA, which is an international space project. He is interested in applying this idea to ALPHA flights.

A group of Russian amateurs have begun to design low cost satellite ground station hardware for use at the gatways. They are seeking comments on the idea and others to help in making it a reality. Clearly the project will require the help and cooperation of amateurs worldwide.

If you are interested in helping to further develop this project please contact Karen,RA3APW, at:

karen@gw.ra3apw.ampr.org
or sysop@ampr.demos.su
or via KO-23, KO-25 satellites

Also, if you know of someone who might be interested and able to help, please forward this note to them.

This note was written and posted for ra3apw by n6gn.

Motorola Mitreks are popular, but another good radio is the Motorola
Maxar/Maxar-80/Flexar (these are all similar - the Flexar is a
Maxar chassis in a cabinet with a power supply).

>source for DX? If not let me know so I can stop wasting my time. de
>Bernie, WR3E.

You have noticed a common usenet problem... some 20.000 newsgroups
were created for discussion about many different topics, yet some
people cannot be bothered to check if their posting matches the topic
of the newsgroup before posting.
The result is often called "noise", and the "signal/noise ratio" of a
newsgroup can be varying, much like the s/n ratio when receiving a DX
station.

Then there are those loud mouth postings, like Dave's. Those guys want
to let the world know they have something *very important* to tell, and
post it in as many newsgroups they can think of. Those postings are
allmost certainly off-topic.

I'm afraid it is difficult to overcome. You will just have to live
with it, and select news software that allows you to quickly skim
articles to see if they are in the "signal" or in the "noise" category.
Some news software will also allow you to automatically skip articles
that are posted to many newsgroups. That will help you to avoid some
of the utter garbage (like "visit my page!" or "make money fast!").

73,
Rob

"Beste" Adriaan.
We weten meer dan voldoende van je uitspattingen op het net.
Ook weten we dat je via deze groep mail post namens haar.
Ze wil niets meer met je te maken hebben en jij hebt nu ook een
vriendin met kind.
Laat haar met rust !
De volgende maatregel is een klacht en mailbomb bij je provider, eens
kijken hoe lang je je internet aansluiting nog kan misbruiken.
Bestel ook niet namens of voor haar een band van de conventie zoals je
pas hebt gedaan.
Laat haar met rust !!!
We hebben je e-mail naam en provider.
Doe normaal, bemoei je met je eigen zaken en wij laten je verder met
rust.
Zo niet ??
Je bent gewaarschuwd en ligt sneller van internet dan je denkt.

een vriend.

4092. RE: RF attenuation of mirrored glass at 900 Mhz ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-03 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10796@wb9mjn.ampr.org>
Source record: 35438

Hi,

I doubt that there is much loss to the coated glass. Mirrored glass, like in mirrors would probably be as attenuating as a sheet of metal, tho.

When we set up the Chicago side of the WB6WEY wormhole, initially, we had a straight shot out a coated glass window, 1 mile to one of our main nodes. With 10 mw, on 1.2 Ghz, it was plenty solid signal. I worked out we had 20 dB margin, theoretically, with the antennas we were using, not considering the glass.

The lower the frequency, the less the loss will be, as attenuation in such mediums is a similar function to an RC decay, with the frequency being akin to the time constant. And since the coating on the glass is a fixed thickness, the lower the frequency, the smaller the thickness of the coating in wavelengths.

Glass coatings are a much smaller problem getting signals out of buildings, than other things. Such as multipath, and absorbtive building materials (concrete, stone facia, corregated steel lined concrete flooring).

When we moved the Chicago side of the wormhole to a new office building, 500 yards, from the same node as before, we had a change in the path. Instead of shooting out a window, we now had to shoot thru the entire building, a building with narrow tall windows, and limestone facia. Additionally, we had to defract over a building across the street. In this same situation, 2 watts was just enuf. And indeed, at times the path to a node 5 miles away, but on xx via much less of the building, worked better than the path to the node 500 yards away.

Here in my home qth, a third floor apartment, with an indoor antenna, I had lots of problems with a J pole antenna because of reflections and rfi. From day to day, there could be a null in the direction of the packet gateway, depending on the movements of metal objects in my , and my neighbors apartments. Additionally, the rfi would squish my computer screen, and make the computer speakers dance.

To get around this problem I built up a flat panel antenna. It has very good F/B ratio, and about 6 dB gain (4 times better than the J-pole). If ur interested in this solution, please E-mail me.

73, Don.

:>Would a NE-602 work? Can anybody help me? Thanks!
:>
:>- John (N3IFG)

The SRA-1 is a commonly available component from Mini-Circuits.

Call 800-654-7949 for their distribution centers. A 1992 catalog that I have lists the SRA-1 for $13.45 for 1-9 quantity.

A NE-602 will probably not work in this application. The SRA-1 is designed to accept a +7 DB LO and +1 DB RF inputs. I don't think the NE-602 handles much above -15 DB for its 1 DB compression point. If you were building a homebrew transverter for weak-signal work, it would probably fair better.

The SRA-1 is a commonly available component from Mini-Circuits.

Call 800-654-7949 for their distribution centers. A 1992 catalog that I have lists the SRA-1 for $13.45 for 1-9 quantity.

A NE-602 will probably not work in this application. The SRA-1 is designed to accept a +7 DB LO and +1 DB RF inputs. I don't think the NE-602 handles much above -15 DB for its 1 DB compression point. If you were building a homebrew transverter for weak-signal work, it would probably fair better.

I am brand new to packet radio and would like some suggestions
regarding books or other printed material about packet radio,
specfically how to access and use gateway nodes, wormholes and other
topics such as BBS operation.. The only book I've read so far is
Your Packet Companion (ARRL). It was of great help but I now need
futher info on the basic side of this subject including TCP/IP etc.
Does anyone have any suggestions?

Thanks in advance and 73

Hi George, I highly recommend Larry Kenney's (WB9LOZ) excellent tutorial
at URL:

http://itg-pc1.acns.nwu.edu/~odenbach/classes/c96/packetradio.txt

Also Packet to Internet Gateways are discussed at URL:

http://www.arasmith.com/n0ary/index.html
A snip from the page
"N0ARY/BBS

The N0ARY BBS is a full service amateur radio packet bbs that also
provides a bidirectional
gateway to internet. The bbs interacts with a powerful natural language
interface allowing the
novice user to "talk" with the bbs. The bbs features many features not
available on other amateur
bbs'.

Scope external trigger on the PTT from the TNC. Channel A on one radio's RX,
channel B on the other. Used a Phillips DSO in digital capture mode.

> I presume that you monitored the Mitrek on a nearby receiver with a
> triggered sweep scope. That would be a valid test for freq stabilization

Actually monitored on *two* radios at once.

> away would hear. Both test procedures are necessary.

All the radios in my test were close enough not to require extension to
standard scope probes. Its quite likely my tests were severely flawed.

But I've read and re-read my VHF and UHF Mitrek manuals and can't find
the reference you make to the 15ms delay for protecting the T/R relay.
Under "Theory Of Operation", section 3, "Power Control and Protection
Circuit", 3.6.2 says,

After 15 milliseconds, C916 has charged sufficiently thru
Q901 to reduce Q902 conduction reverse biasing CR902. This
allows U901-2 to be pulled low and U901-6 goes high turning
on Q903-Q904. As the power amplifier turns on, the voltage
drop across R801 increases allowing Q902 to conduct harder.
CR902 is again forward biased allowing the control voltage
to be reduced to its adjusted value.

Having just killed a week fixing a couple of radios that had problems in
that area, I think C916 allows full power output as set by R911 until

C916 gets charged and then R909 regulates the power output. It looks like the PA powers up hard, then backs off. I haven't found anything in the schematic between the PTT line and T/R relay that would delay the signal. Haven't put the scope on it to see how long it takes either.

The radio above that had problems was the same I did the original test with. Am not positive the circuit was working when the tests were performed.

What's 18 ms between friends? I tested all I had because I was looking for whatever variations I could come up with and attempt to relate that to my body of experience. Was really curious what the limit was on access to the local PBBS's Alinco DR1200 on 9600.

> >The Alinco wasn't heard by the Mitrek or Icom for 150 ms, plus

> html.

That's great! I'm looking forward to it. On a related subject, does anyone know how to translate binary output for an Epson FX80 printer into a good form for posting via html? Am thinking of something cleaner than, "print and scan." I have a serial printer port on my Phillips DSO that could crank out interesting scope shots.

> One problem with 9600 however is the relatively large modulation coupling
> capacitor used with the G3RUH modem. The time constant on the capacitor

> radios adopted to that modem.

I'd like to crunch on that subject some more. The DRSI DPK-9600's that we have for this task won't drive 5V to 8V that G3RUH's will, at least without mod. My Icom takes 1.0V in for ~3.5kHz deviation, and outputs ~1.0V for same RX'ed signal. Thought that sounded like a good standard for my

Mitrek project. Reprograming the output stage is fairly easy. Rather than install an opamp into the box I reworked the existing mic input amp. It uses a push-pull pair of 2N3904/2N3906's. Changed their gain resistor, cut out most caps. Changed the input 0.047's to 10 uF. Did a lot of playing with an audio signal generator, and think I've got pretty good results. Have thought about shorting the 15uF in the output of the DRSI as its redundant. So there is plenty more stuff to discuss....

I'm having fun in amateur radio again.

i have 2 kantronics dvr 2-2 radios for sale, $100 each and i also
have an alinco 1200 for $225... i am taking down a node stack in
a few days, and will be putting the following up for sale...

data engine, 2x9600 modems
kantronics 4-10 uhf radio on 446.100
kpc-4
alinco 1200 (used on 9600)
2 icom ic-27h radios

this package gives 2 9600 baud ports and 2 1200 baud ports...
i would like to sell as a package... i will not sell the 4-10 radio
separate from the package - don't ask...

let me hear from u if interested...

>Maxar chassis in a cabinet with a power supply).

Beware of Maxars at high RF sites. They aren't shielded worth spit.
Even at home they are subject to direct RFI pickup from computers
and such. If you put one in a metal box, with all external leads
suitably bypassed, it'll do. They've got decent front end filters,
but that doesn't do you any good when the signals can just bypass
the filters and enter directly through the plastic cabinet. We've
even had problems with SW stations getting directly into the IF.

We used one of these on a high RF site, and it was useless until
we wrapped it in aluminum foil (not a preferred fix). Better is
to repackage it in a suitable metal box. The Mitrek is a lot less
work to get to survive at a high RF site.

Correct, which is why you don't modulate them by varying the supply
voltage. Instead you use a separate modulation diode. M/A Comm gunnplexers
are routinely used for 30 MHz FM video. They'll handle a good 10 Mps
modulation too.

> (if anything) can I try to adjust to improve this? Thanks in advance.
> 73,
> Jerry, AA2ZY

Jerry,

Two things to check:

1. Do you get lots of rejects when the channel is clear - you are the only one on?

If so, you might be suffering from multipath - signals from hills, buildings etc that mix with the direct path signals so that your packet equipment can't receive the correct ones.

Or, your signal levels (between the Baycom modem and the radio) could be too high, leading to overmodulation (sending) or overloading (receiving).

2. If you are OK operating on your own, but not when others are operating, look at your TXD. If it is too long, then whilst your system is thinking about sending a packet, another with a faster timing will hop in and start sending. Then yours will send and the result is a collision and a consequent reject.

It may mean that you should get a faster radio - see the comments re radios for 9600 bps on this newsgroup.

By the way, the current BAYCOM version is 1.6. You should be able to find a copy on the TAPR ftp system.

73,

Jim. ZL2APE

I bought a Timewave DSP-59+ at a swapfest a number of months ago hoping it would help with noise reduction on SSB as described by Timewave. So far, though, it seems noisier on than off, and is only useful autonotching hytrodynes, which a much cheaper Radio Shack unit does equally well. The DSP-59+ performance is nothing remotely close to the glowing testimonials Timewave shows on its web page. Could it be defective, or ???

I was just about to start putting one of these together with modifications for 10 Mbps operation when I noticed that my schematic and the receiver board artwork didn't seem to match. I have a copy of _Packet: Speed, More Speed, and Applications_, but I just recently found out that the receiver board schematic is incorrect in many places. I hear that the '91 Handbook or the Dec. '89 issue of Ham Radio Magazine has the correct schematic. Could somebody with a kind soul, a copy of the forementioned texts, and a scanner email me a copy, perhaps? I'd really appreciate it! Thanks.

- John (N3IFG)

P.S. Thanks to everyone who knew where to find those SRA-1 mixers. Sorry, I didn't get to respond to everyone personally, though (my current news server tends to drop posts....)

4112. Plug N Play vs Innovation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-04 00:00:00 UTC
From: n7tcf@primenet.com
Message-ID: <4u28f5$835@nnrp1.news.primenet.com>
Source record: 35358

Plug N Play equipment comes only after commercial interests see a clear
profit. This is why such things exsist.
It is up to the clever and innovative ham to push the envelope bit by bit
to increase the popularity of faster digital modes and microwave transcievers.
I hear two frequent complaints:
"I don't have the skills needed to build or modify advanced equipment."
"I can't afford the new equipment."

Well, budget problems are legitimate, but can be overcome by time. And
this is a hobby after all. Lack of skill can be overcome as well, just why did you
get a license anyway?

Jim N7TCF

4113. *** FOR SALE **** KANTRONICS KPC-3 TNC !!!

Hi
I have a Kantronics KPO-3 TNC for sale. It comes with the
original box/manual, and the necessary DB-9 solder cup connector
and cable for a Radio-TNC connection. Please send email to
swamik@ele.uri.edu for details. Thanks and 73

4115. Re: RF attenuation of mirrored glass at 900MHz?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-04 00:00:00 UTC
From: Jack Daniel <jdaniel@earthlink.net>
Message-ID: <3204EFB9.50BF@earthlink.net>
Source record: 35361
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc

Like most RF propagation obstacles, the attenuation through windows and walls vary greatly according to variations in materials, location, window size, antenna (or radiator) locations, etc.

We have several successful 'through windows' bi-directional amplifier installations with widely varing frequency bands and building/window types.

In general, a 15 dB "use factor" commonly included in the calulation will cover a clear glass and most green or brown tinted windows, BUT...

I have one case in a 50 story building that uses thick, highly mirrowed (gold color) glass that has a measured MINIMUM loss of 40 to 45 dB at 950 MHz regardless of antenna location within the room. It was also found that the window has such high reflections that multipath calcellations could result in a effective loss of over 60 dB. There may also be some aperature size related problems, but that could not be verified because we could not easily alter the window size at the time.

As a suggestion, you shouldn't cut a design too close. Even if the current situation indicates you will have a small, but usable, level margin chances are you will be back soon to add more margin to the system. In real life, signal levels always degrade due to uncontrollable external events such as somebody changes the building layout or the window material/window coatings. Also keep in mind that the new 'wireless' products that will be coming out soon may emit several types of interference and/or noise that reduces your systems performance.

Solving in-building and underground radio propagation problems is an interesting and challanging 'art'. Have fun and Good luck.

4116. FCC Ruling Will Require Some Hams to File Environmental Impact Reports

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-04 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <4u2uvk$8bd@news.accessone.com>
Source record: 35362
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

The FCC has issued new rules regarding the evaluation of RF Emissions and
health effects from all transmitters. As always, the devil is in the details
and the details say that if you transmit over 50 watts, you may have
to perform an RF emissions environmental assessment of your Amateur station.
Under the new rules, the FCC will add five more questions on RF safety to three
of the written exams. Amateur radio operators will be required to certify as
part of their license application, under an as yet unspecified mechanism, that
they understand the FCC rules on this issue. In some situations, certain
Amateurs may have to file a complex "Environmental Assessment" better known as
an Environmental Impact Report regarding their Amateur station operation.

You can read the complete text of the relevent FCC ruling in FCC 96-396 at
Ham Radio Online magazine, available on the Internet at:

4119. RF expouse limits

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-04 00:00:00 UTC
From: Phil Sussman <pactor@pactor.com>
Message-ID: <32053BD5.625B@pactor.com>
Source record: 35365
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy

As you might be aware, the FCC has set Jan -1, 1997 as
a compliance date for all US ham radio operations to comply
with NTIS Bulletin 65 with respect to RF exposure limits.
This would SEVERELY affect operators of FSK and PSK
because they are considered 'continious transmissions'

There is an FCC imposed exemption for any transmitter
UNDER 50 watts. Over 50 watts, a ham must insure that
he complies with NTIS-65.

I am looking for a copy, preferably on-line, of NTIS
Bulletin 65.

Can anyone help on this?

73 de Phil - KB8LUJ

regarding RF exposure limits.

>>Exactly. Also, there is no reason for the sats to be limited to
>>anything less than T1 speeds.
>
>Aha! You clearly have experience with fast satellite links.
>Please publish your T1 speed satellite link station design.

Ah, lets see, a 5 meter Ku band dish, 350 watt TWT.....

When you start expanding bandwidth to carry high speed data,
or video, the link power budget quickly grows large (and
expensive). Receive only stations can be a lot more modest,
a 1.2m dish and 60 degree LNA, if the sat has sufficient
transponder power (but that's really expensive).

It may not be quite that bad if the sat has spot beams. You
could probably get away with a 3 meter uplink dish. This
assumes a GEO sat (which amateurs don't have) of course.
If you could use a LEO, the link budget wouldn't be quite
so severe, but then you'd have tracking, and the doppler
problem to deal with.

At the frequencies where sufficient bandwidth is available,
the doppler would cause the channel center to wander tens
of kilohertz in a matter of seconds (at zenith crossing).
This poses a real problem for the sat since each packet
won't necessarily come from the same place in the footprint
as the last (or the next), so the sat's receiver is going
to have to compensate doppler on a packet by packet basis.
The Earth station has an easier time of it since it can
pre-compute the doppler for the pass.

And if a LEO were used, at T1 rates the on board store and
forward memory requirement would quickly get totally out of
hand. You'd have to fly a disk drive, and the reaction forces
from that would make sat stability a serious concern. The
sat has to rotate once per orbit to maintain Earth pointing
antennas, but the disk would act as a gyro trying to keep
the sat pointing in a constant direction (by celestial
coordinates). That would cause a precession moment on the
sat, IE it would start to wobble.

Commercial GEOs have T1s on them today (realtime relay, no storage).
But it isn't cheap. The world's amateurs are straining to fund a
satellite which can handle 56 kb. T1 is an order of magnitude harder.

A T1 with store and forward isn't something even the commerical boys
want to tackle.

The Big LEO boys intend to do any store and forward on the
ground, using control stations spotted every few hundred miles
under the sat's track. They're actually only using the sats
to cover the "last mile" and the bulk of the data will be
on terrestrial fiber. They can get away with that because
they're going to have trains of sats, with another coming
along moments after the last one. Amateurs can't afford
that. One T1 grade sat would be a tremendous accomplishment
for amateurs. So the sat could only move the message a
few hundred miles per orbit if it depended on ground station
storage. HF can beat that.

My experience with the DSP-59+ is about the same. Once in a while it will make the difference in making or not making a QSO, but most of the time I leave it off. The heterodyne killer works very well, but the rest of it was a disappointment.

4126. APRS GPS-20 Purchase

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-05 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <671942.ensmtp@teachnet.edb.utexas.edu>
Source record: 35372

TAPR offers group GPS purchase Update 8/5/96

This is the second round on the Garmin GPS-20 units.
There are another 30+ units available in the purchase.

General Information

TAPR working with Bob Bruninga, WB4APR, will be making a group purchase on
Garmin 20 GPS units.

For full details on the purchase as well as information regarding the unit,
please see the following web page

http://www.tapr.org/gps -- it contains photos!

The price will be:
$169.00 US for members of TAPR
or
$179.00 US for non-members

This kit will include:
* Garmin GPS-20 (MultiTrac8 sensor) engine (1.83" x 2.74" x .45")
The Garmin GPS-20 is similar to the Garmin GPS-45

* RF pig tail with connector for unit
(one end is the MCX male connector
and the other end will be non-connected - see below)

* power/data cable with connector shell and pins
(The connector is a subminiature PCB edge connector
and will need to be built - see below)

* Documentation

TAPR will be taking orders for 100 units, which is the minimum purchase.
Once 80 units have been purchased TAPR will order the Garmin units.
TAPR will deposit money when the units are ordered from Garmin and ship
when the units arrive from Garmin.

Please note: This is not an enclosed/sealed unit. It is assumed that
the purchasers will be installing the unit in another enclosure for normal
and experimental operations.

No 10% Discount for TAPR Members. Due to the nature of the purchase,
the $165 purchase price for TAPR members represents the membership
discount.

If you would like to order one of these units, you can
e-mail tapr@tapr.org,
phone (817) 383-0000, or
fax (817) 566-2544.

Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time

These units will be useful with current APRS software and the upcoming TAC
(Totally Accurate Clock) kit that Tom Clark, W3IWI, has begun discussing
with TAPR to do as a kit in the future. For more on the TAC project
check: ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

Questions concerning the unit and details on the buy will be handled on
the TAPR APRS Special Interest Group list. To subscribe,
send e-mail to:
listserv@tapr.org.
In the message type
subscribe aprssig YourFirstName YourLastName.
The server will then send you a message back. Announcements on the status
of the shipment will be made to the TAPR APRS SIG and TAPR-BB lists.

Shipping and Handling
---
* Shipping and Handling within the US will be $7.00 US
by UPS Ground unless otherwise requested by purchaser.

* International Shipping will need to contact the TAPR office and get a
quote on the shipping to your country. TAPR uses International Express
Mail, unless the purchaser requires something else.

General Information

All Garmin engines come complete with DGPS input capability
(see note below), PPS timing output and lithium 3V battery on board.

MultiTrac8: Tracks and uses up to 8 satellites for accurate, reliable
GPS data at an incredibly low 1 watt power consumption. Unit has and a
real time clock, PPS timing and nonvolatile memory right on the board.

Footprint (1.83" x 2.74" x .45")

Architecture Patented MultiTrac8

Time to first fix
reacquisition < 2 sec
warm 20 sec
cold 2 min
sky search 15 min
update rate 1 sec continuous

Dynamics
velocity 999 knots
acceleration 3 g
jerk 20 m/s^3

Datums 102 predefined, 1 user defined

Electrical
input voltage 5.0V DC +- 5% regulated
(a suitable regulator should be used)
power consumption 0.8 watts
backup on board 3V lithium (10 year lifetime)
sensitivity -166 dBW

Connector
antenna 50 ohm MCX female connector for active
(5V DC @ 15ma) or passive antenna
power/data single row, right angle 12 pin male

Physical
configuration 1 integrated board engine
size 1.83"W X 2.75"L X 0.45"H
weight 1.1 oz
op temp -30 deg C - 80 deg C
(remove Li battery for extended usage above 80 deg C)
storage temp -40 deg C - 85 deg C

Interface
compatibility 2 RS-232 serial ports
data rate User selectable baud rate
1200/2400(tx only)/4800/9600
format NMEA 0183 v.2.0, ASCII
inputs Initial position, date and time (not required),
2D/3D & earth datum command,
RTCM-104 v.2.0 differential
outputs Position, velocity & time, receiver and
satellite stautus, geometry and error estimates
timing output Timing output with +- 1 microsecond accuracy

Frequently Asked Questions
---

* Any altitude limitations?
The GPS engines will deactivate themselves above 50,000 feet.

* The Garmins only send out final solutions (NMEA sentences).
There is no other data available from them (including preprocessing data).

* The Multitrak8 has only one channel, but is multiplexed.

* The Multitrak8 can accept DGPS signals (see note below).

* Antenna options (which can be purchased directly from Garmin if required)
include:
- mag mount
- flange mount (bolt to a car)
- trunk clip
- suction cup mounted

* The unit has true time clocks, PPS timing, and nonvolatile memory
on board.

* The interface is NMEA 0183 (TTL levels) and RS232 (+ and - 15 volts)

* The unit can be powered by AA batteries.
Batteries or external supplies will require a suitable power regulator.

* The unit only gives NMEA sentences as output, no extraction
of RTCM-104 data.

* There's no problem with the antenna being close to the boards.
All sensitive components are shielded.

* The unit has a LNAs and you can use passive antennas.
You need to keep the antenna runs short however.

* The antenna is attached with a MCX connector, which is a friction
lock connector. A male MCX connector with short RF cable is included
in the kit purchase.

* There's a header for connecting the data cables.
A connector and cable will be included in the kit (it will need
to be soldered). The connector is a subminiature PCB edge connector.
This is not the same connector as used with many hand-held units.

* You cannot adjust the intervals that the boards outputs data.
However, you can adjust their baud rate. At 4800 the boards repeat
data every 2 seconds. At 9600 baud, data is repeated every 1 second.

* The boards do adjust for leap seconds (via the satellites).

* For DGPS, since these are just the boards, you can't use the Garmin DGPS
receivers. The Garmin units get tuning instructions from the GPS keyboard

(which are not on the boards). To receive DGPS signals, you'll need a
tunable beacon receiver. Correction signals are sent in through the
data in cable (just like the handhelds).

4133. ARRL and TAPR Digital Communications Conference, Hotel Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-05 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <673128.ensmtp@teachnet.edb.utexas.edu>
Source record: 35379

ARRL and TAPR Digital Communications Conference, Hotel Update
Seattle, Washington, Sept 20-22, 1996.

Several people have called the TAPR office informing us that the DCC Conference Hotel (Quality Inn) had some error in their system over the past week in regards to the DCC.

The error was that they had canceled our conference :-)

If you called the DCC conference hotel in the last few days and were told that the conference had been canceled, it was not. This has been corrected at the hotel. Please call the Quality Inn again and make your reservations.

Be sure to tell them that you are with the 'ARRL and TAPR DCC'.

If you are coming in Sept, be sure to make your room reservations early in order to get the rooms that are available in the Quality Inn. Rooms in the Radisson are slightly more expensive in costs. We have a room block until the first of September, but that block is filling quickly.

For full details on the ARRL and TAPR Digital Communications Conference, check

http://www.tapr.org

or call the TAPR office (817) 383-0000.

ARRL and TAPR DCC Hotel Information

Conference presentations, meetings, and workshops will be held at the Quality Inn Seattle Airport, a complex co-located with the Radisson Hotel Seattle Airport. Rooms rates are $66/single-double and $76/triple. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. It is highly recommended that you book your room prior to arriving - a block of 75 rooms is reserved until September 1st, 1996. After the 75 rooms are booked, rooms will only be available in the Radisson hotel, but will be at a higher price. Be sure to book your rooms early! The hotel provides transportation to and from SeaTac Airport. You should contact the hotel to arrange airport transportation.

Quality Inn Seattle Airport (conference hotel)
17101 Pacific Highway South, Seattle, WA, 98188
(206) 246-7000, Fax (206) 246-1715

Radisson Hotel Seattle Airport (alternate hotel)
17101 Pacific Highway South, Seattle, WA, 98188
(206) 244-6000, Fax (206) 246-6835

Clifford H. Gieseke <cliffg@texas.net> wrote:

>I bought a Timewave DSP-59+ at a swapfest a number of months ago hoping
>it would help with noise reduction on SSB as described by Timewave. So
>far, though, it seems noisier on than off, and is only useful

It could be defective. Or it might not be adjusted correctly. Check the
manual to see how to adjust the "aggressiveness" of the noise reduction
algorithm. You can set the default via internal jumpers, and on the fly.
Press the NR button. Then turn the left knob to the 6:00 position (you'll
hear a tone). Then adjusting the right knob for best balance of
noise/intelligibility. When you take the left knob off of 6:00, that
setting will stay on until you power off or change it.

Be careful not to overload it. An occasional flash of the red light is
OK, but if it's on most of the time, lower your receiver gain and turn up
the Timewave's volume.

The noise reduction is most effective on "white noise," and less so on
static crashes, spikes and power line noise. You can also eliminate a
lot of low frequency hash by keeping the low frequency cutoff at 300 hz,
or even higher when listening to higher-pitched voices.

I am *very* happy with my 59+.

4135. Minimum separation on 2 meters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-05 00:00:00 UTC
From: jtaylor@huachuca-emh8.army.mil
Message-ID: <199608052147.OAA14803@UCSD.EDU>
Source record: 35381

Here's a topic I can't seem to find much information on. What's the recommended minimum frequency spacing for two nodes located within 100 feet of each other at two meters? My old ARRL publications suggest a horizontal antenna spacing of 1 mile or more for the 600 KHz repeater splits.

However we are facing a situation where another group has installed a node on 144.93 running 5 watts and is only 100 feet from our 145.01 node. They insist there will be no interference. Of course with packet, it's a often difficult to tell what is happening, or why it's happening on a very busy mountain top.

Does anyone on this group have guidance on recommended minimum spacings? Is the old ARRL "1 mile or more" rule still valid?

Interesting point. You may be right. Still, it irritates me that FCC has
any questions on RF emissions and safety other than the usual "why
should you not hang onto an antenna when someone's transmitting a gallon
on it?". While at microsave frequencies and above (and, perhaps, at high
UHF), disastrous things can happen when humans get in the way of
high-powered RF fields, I am not at all certain (learned ptomes on this
newsgroup to the contrary notwithstanding) that RF emissions pose a
serious hazard at VHF and below. Certainly the Novice question-pool
question as to why one should keep the rubber duck antenna of a HT away
from one's head when transmitting seems to me not to be proper exam
material in that IMHO the jury is still out on RF problems at VHF and
below.

I know, at least, that I've used HTs with rubber ducks for over twenty
years and haven't noticed a thing other than the financial drain of buying
battery packs!

>electromagnetic radiation from your station all these years could he hold the
>operator liable because he had knowledge of the EPA guidelines of RF radiation
>?.

You bet. The lawyers will love this. But you can be sure that the
manufacturer of the radio will be sued too. Remember the deep
pockets rule. General aviation was nearly ruined because the deep
pockets rule meant that the aircraft manufacturer was always sued
when some pilot did a stupid thing and hurt someone. The legal
theory was that the manufacturer should have built the plane so
that the pilot's stupidity couldn't cause an accident. Same logic
applies here.

>Also I wonder what the FCC intends to do with all the land mobile equipment
>as most all is 100 watts. The article implies a mobile station operating over
>50 watts could also not be in compliance with the guidelines..

Worse than that, Gary, the 50 watt exemption only applies to *amateurs*.
It does not apply to other classes of licensees. They've got to certify
compliance at *any* power level. Note that "push to talk" *radios* are
exempted from certification by their *manufacturers*, but *stations* using
such radios are not. The *licensee* is still responsible for seeing that
his station operates in compliance with 47 CFR 1.1307, 1.1311, and 1.1312.

However, Part 90 *portable* radio stations are categorically exempted.
I'm not sure the FCC considers "mobile" rigs to be "portable" radio
stations. If not, *each* installation must be certified. Otherwise,
they're exempt *regardless* of power level. Cops always seem to be
"more equal" under the law than you or me.

This thread is certainly bringing some much needed attention to the situation. I exchange approximately 15-20 personal messages per week from the east coast U.S. to Europe using the packet system. In some cases the messages originate on local PBBS's (VHF) for transmission, on more distant U.S. HF BBS's (PacTOR) or on European HF BBS's. Delivery rates are 100%. Delivery times vary from 1.5 hours to 2 days. Lately we have experimented with routing protocols and procedures for a number of stations (opportunities for improvement there). The key points I see in this thread are: 1) No telephone service, no electricity=no internet (try loading web information during a hurricane), 2) There are significant experimental opportunities to improve the medium and the process, 3) Other areas of the world are continuing to improve both the packet process AND the delivery of Internet access (e.g., Central Europe had ISDN and interactive cable 5 years ago). IMHO, I would enjoy seeing some more creative, aggressive attacks on the problems of VHF packet and HF Digital, rather than elaborate discussions of its current shortcomings.

I have a somewhat different view of this situation. I am sailing a boat around the world and looking for a good way to get personal E-mail to/from the Internet (the freinds here are all hams with no Packet equipment, but internet accounts of one sort or another).

My problem is that all the HF BBSs seem to be so busy forwarding traffic that logging in as a "user" is very difficult. Propagation from the Venezuela Coast and Guatemala to the US doesn't help the situation either!

Even so about 60% of the BBS stations I call have some sort of response like "we do message forwarding only - don't even try to log on".

I am currently looking at Global Wireless' commercial service since at least I can get in! Very expensive for saying "Hi we arrived ok" to Aunt Minnie though - especially when Ham radio is supposed to be available for this!

Right now in the Caribbean there are almost 1000 hams who would really like to see something like this - not just to the US but to Europe, Australia, NZ etc. as well.

In fairnesss, once I have got into a BBS station (e.g. WG3G/9y4), the forwarding and internet interface portions have worked very well.

Before people go ballistic over this, let's get the facts. Can someone find out what these rules actually say about amateur stations, if anything? What does "MAY" have to perform an RF environmental assesment mean? Does this apply to sporadic transmissions like ham stations, or only constant emissions like broadcast, cellular, relay towers, etc. Are frequencies taken into account in any way (certain parts of the VHF, UHF, and microwave spectrum have much greater potential for biological impact than HF or other frequencies. Is there a certain distance from an antenna to the nearest house, etc. that would exempt most of us? Also, don't all proposed new rules have to go through a comment process?

There already are "environmental impact" rules about antenna structures, and 99.9% of hams just check a "No" box on Form 610 and get on with their lives.

I'm sure the ARRL, not to mention many commercial organizations, would raise quite a squawk if every user of a 50+ watt transmitter in the U.S. had to file Love Canal-style paperwork. This would involve every police and fire department in the country, for starters.

An EA filing would be required if a station is out of compliance with
the new exposure rules and wishes permission to operate anyway. Without
a complex, costly, and time consuming EA (and favorable FCC action,
frankly unlikely), an amateur station *must* be brought into compliance
with the new rules by Jan 1 1997.

This is likely to affect a considerable number of amateurs. I'd
suggest most amateurs running more than 50 watts who use an indoor
antenna are out of compliance. And those using low outdoor antennas
may have to install fences with access interlocks before being able
to crank the power back up over 50 watts.

OTOH, if your antenna is more than 10 meters above any horizontal
surface where a person might stand, and you're running no more
than 1,000 watts ERP (that's your output power minus feedline
loss and plus antenna gain), you're probably Ok. You'll need to

evaluate each situation, however, to be sure you are in compliance, this is only a very crude rule of thumb, and not sufficient to assure compliance (your MPE might still be too high in the above scenario depending on antenna type and orientation). The chart in Appendix B of the report and order gives the allowable limits for controlled and uncontolled exposures at various frequencies (exposure limits are different for different frequency ranges).

The controlled exposure numbers are the limits for *your* exposure. The uncontrolled exposure numbers (much lower) are the exposure limits for any member of the general public due to your transmissions. This latter number is likely to cause problems for those operating in apartments or condos. (The numbers are approximately 30 times lower than the previous ANSI limits the FCC has used in the past for licensees not exempted, IE broadcasters. Amateurs *were* exempted, but no more if they run 50 watts or more.)

If we follow the good amateur practices of mounting our antennas as high and in the clear as possible while running the minimum power necessary for communications, many of us will be Ok. The problems are going to arise for those using indoor antennas, low outdoor antennas in access uncontrolled areas, and for those with close neighbors or public throughfares. HF mobile operators are going to have to be particularly careful. Operating in a parking lot, or in heavy traffic, could easily put you out of compliance unless you drop your power to below 50 watts. There aren't many VHF+ mobile operators running more than 50 watts, so most of them will be exempt. Those who are running 50 watts or more, however, are going to have to take steps to limit exposures.

People running glass mount antennas are almost certainly out of compliance with even the controlled exposure limits, but remain exempted if they're running less than 50 watts. That's not a good reason to still be suffering excess exposures, however, and prudence would suggest getting rid of that glass mount and drilling that hole in the roof like I've been urging you to do for years.

Repeater owners may be in particular trouble if their site isn't controlled access (and even if it is if the *combined* exposure from all sources on the site exceed the controlled exposure limit). In the latter case, *everyone* will have to shut down any time maintenance at the site is to be performed (or suitable protective clothing will have to be worn by the maintenance personnel entering the area). This is a *biggie* folks, and may limit amateur access to many places where we've traditionally sited repeaters. The site owner is going to be held primarily responsible for seeing the exposure limits aren't exceeded, and they're going to turn a fish eye on amateurs trying to cadge a free site. (Get your "moon" suits now, it may be the only way you'll be allowed onto many sites.)

Note, we don't have to file an EA unless our station is out of compliance and we want to operate it anyway. But we *do* need to do the measurements or calculations showing that our station *is* in compliance with the exposure limits if we run more than 50 watts. This information must be kept with our station records, and be available for FCC inspection at any time.

Some of the limits are going to be hard to measure. For MPE, above 30 MHz there aren't any trustworthy instruments available. The FCC is going to allow us to measure the Volt/meter field and calculate the MPE from that. For well characterized antennas, the FCC will also let us depend on computer simulation calculations. For SAR limits, that's the only prudent way.

Hardware gurus need to be designing suitable instrumentation for us to make sure we're in compliance (and suitable field calibration techniques to assure us the instruments are trustworthy). Software gurus need to give us computer programs to model exposures. Both of these are going to be tough tasks if they're to work in the real world where our stations operate, and not in some idealized free space.

Remember, we have to have documentation on file with our station records showing that we are in compliance before we can run 50 watts or more. 49.99 watts may wind up being the new defacto amateur power limit if we can't come up with reliable hardware and software to document that we're in compliance with the new exposure limits.

To my thinking the real, immediate problem is that IF the amatuer station has to file an EIS, that gives every neighbor and enviro-busybody an invitation to object, delay and appeal the "construction" of the station. Out here on The Left Coast, that practically guarantees a group of hystericals and allies from The Birkenstock Brigade adding their 2 cents worth to every station they decide is a "risk". Remember how ham radio got pilloried by KING-TV, Channel 5 when the neighbors set on sacrosanct magnolia Hill had problems. I can't wait for that old rag Jean Ennerson to find this issue to crusade on.

Amateur radioers,

I have inherited a rather larger (around 12 foot) parabolic antenna, 80's vintage with two sets of Digital Satellite positioners and recievers. The LNA on the antenna says 300 K.

I plugged everthing in and found that the antenna positioner controller and driver motors worked wonderfully despite their well-weathered appearance.

Unfortunately, I was unable, due to my ignorance,to get a picture on a small black and white TV I connected to the reciever output. The terminals are all labeled +- 18 volts, +- 5 volts, video out, audio out, pulse.....

The system does not have a 'descrambler' and I have been told the system won't work without it.

Are there any satellites that downlink anything 'non-scrambled' ? I'd like to continue to tinker with this system if I can find some use for it.

Can I possibly transmit with this device ? How much professional training and equipment do I need to bring this old system up on line ?

Are their any good entry-level texts that explain, in basic terms, how to assemble, test and apply this wonderful old system ?

Thanks for any input you may have !

Many of the SSTV programs are very fussy about the types of
video displays supported. Take a look at EZ SSTV version 3.
It operates in 9 different display modes (640x480, 16/256/32k/65k/16M
colors and 800x600, 256/32k/64k/16M colors).

CORRECTION
Contrary to our first reading, it does not appear likely
that any hams will be subjected to filing EIRs. Word to the wise:
Don't read government legal opinions while your 9 year old daughter is
holding a big birthday party with a crowd of 9 year olds :)

While the ruling does place additional rules and compliance
issues upon Amateur Radio stations, I'd guess that having a
federal standard will help to prevent lots of local
municipalities from creating their own, usually ill
considered regulations on RF emissions.

We corrected the web article shortly after posting on Usenet
(which you can retract once posted). Oh well.

Interesting play anyway Ed and Kim. I went to the FCC server and got down the whole 1 meg Word Perfect 5.1 file anyway. Haven't read it yead, but I will. It probably is close to the ANSI standard stuff that is already in the ARRL handbook and not a bad view of life anyway. Actually, if you look at the charts and do some real thinking, the curves and distances for you to use in plotting "safe" spacing between you and your antennae, they are not all that unreasonable. When laying out my more recent antenna arrays on low band stuff for the vertical arrays, I did the check runs for the space required by the new projected standards and my operating position.

What I found was interesting from a far different perspective! Considering that feed line lengths are part of the limiting factor on how far away you can afford to go to get to an antenna and the higher the frequency is, the shorter your pocket book gets, a curious thing happens.

There is so much interaction between vertical arrays and other vertical arrays that are higher than them then the whole business of how far away they have to be from the shack is somewhat moot! If you lay out a plant with anything like the right minimal spacing so that the bigger and taller arrays don't tear up the shorter higher frequency fellers, the spacing from the user is so far above the proposed new standards that they are, in effect, meaningless.

To keep a 160 meter vertical from tearing up an 80 meter 4 square array takes about 600 feet of lateral space separation.......

Plot it all out with MN or whatever.. You'll be surprised. It takes real work to figure out how to hold interaction down without spacing separations like that...

After having worked in the broadcast business as well as being a ham, I really don't want to put an indoor loop antenna in my appartment and then feed 2KW PEP into it, nor do I want to put a three element beam on a roof top rotator right above me in the attic and toss 2KW PEP into that either. Surely running the limit on RTTY that way must make it worse even by common sense.

The charrts that are there are interesting. Mobile unit field levels are also interesting when you take a look at what is happening there.

High power VHF stuff does present hazards...

For you to have simply gotten the attention of some people and perhaps piqued their interest in the issue, may have helped..

Oh knowledge of the affair isn't really required! Product liability, for example
transcends all reasonable sane limits for time elapsed on that, with or without

knowledge.

I am familiar with one lawsuit now going on where the product involved was built in 1978. The claim is the gate design on a cattle trailer was defective and the user had the gate come open last year and the cows fell out and caused a massive traffic accident.

Allegations seem to be that because the design was copied from another product back in 1963, it is really not the copiant that may have the final liability, but the party from which the design was COPIED!

For millions of dollars in claimed damages.....

:)

You can get it at www.fcc.gov where it is in the technical bureau section.
It took me a while to find it, but there is a "NEW" notice flaggin it right
at the top of the department's page.

It comes in two flavors, an acrobatic clown version and perfectly worded
verison which you will likely have to convert from Word Perfect 5.1 to
read.

I think the WP 5.1 version came in at above 1 Megabyte in size!

When in the Lord's name not taken in vain, will anyone EVER listen to
the idea to post standards in standard text format as in plain ASCI text
with NO art work, just words.

"Words, words, they kill us with words... and the first thing we
shall do is....."

This could get real interesting. Since the article says the station location
and all occupants are in a controlled enviroment. They consider neighbors and
such to be uncontrolled. I wonder what will happen if a neoghbor comes down
with some mysterious illness like cancer and notices he has been bombarded with
electromagnetic radiation from your station all these years could he hold the
operator liable because he had knowledge of the EPA guidelines of RF radiation
?. Also I wonder what the FCC intends to do with all the land mobile equipment
as most all is 100 watts. The article implies a mobile station operating over
50 watts could also not be in compliance with the guidelines..

If you have accurate specs on your radios and knowledge of the RF output powers and patterns of the antennas, you can "do the math" and figure it out.

I would say any of the 'broadband' class of 2 metre radios on the market will completely wipe each other out, regardless of how far apart they are in frequency.

If you want to add a bandpass/notch cavity, its a different story. At a site I manage, we have bandpasses on our japanese 2 metre radios, and they are ~1.5mhz apart. They don't seem to affect each other.

If you going to have two nodes on without any cavities, put them as far apart as possible. If they are only 80khz apart, you'd have better luck moving your 145.01 node to 144.93 because at least you'd have some hold-off.

> My old ARRL publications suggest
> a horizontal antenna spacing of 1 mile or more for the 600 KHz repeater
> splits.

Yeap, without cavities, thats a good rule of thumb. It also depends on how clean the transmitters are as well as how big a signal the RX can look at before it is overloaded.

>
> However we are facing a situation where another group has installed a
> node on 144.93 running 5 watts and is only 100 feet from our 145.01
> node. They insist there will be no interference. Of course with
> packet, it's a often difficult to tell what is happening, or why it's
> happening on a very busy mountain top.

Even with a SERIOUS dose of cavities and notch filters, and commercial gear, I'd bet good money that this is not the case. Now some vertical separation might help (100 feet directly above or below your antenna).

Here is a good test. Find a weak carrier. Lets say s-3 or so on 145.01. Maybe someone with a HT could key up in the distance. Then watch what happens to the signal when the 144.93 rig keys up. Your 145.01 signal mostly likely will completely disappear. Your retries are going to go up drastically. Now, if the 144.93 node gets very little use, then yes,

it may not interfer much (because no-one is using it). But I'd say its
a very poor idea.

>
> Does anyone on this group have guidance on recommended minimum spacings?
> Is the old ARRL "1 mile or more" rule still valid?

I think your best bet is to have the 144.93 group 'prove' that it doesn't
interfer with your node. Don't forget, your 145.01 station will also be
interfering with them. So I think your best bet is to work with them.

>it don't you, folks?

I do! Imagine if everyone voluntarily kept their output power limited to under 50W. Remember, we're supposed to run the minimal power necessary for reliable communication. Since folks don't self-police themselves in following this regulation, we'll now have the government carry out those duties. But we can thank the FCC for *raising* the cutoff to 50W; the original proposal was for a lower power level.

As long at that is 50W output and not 50W ERP, just think of the more efficient antennas that are going to be sprouting from each shack now.

***** Breaking News Story *****
FCC Ruling Prohibits Unreasonable Restrictions on TV Antennas
by Ham Radio Online, 7 August 1996

In a major ruling, the FCC declared void local laws prohibiting
or restricting the use of small wireless dish antennas.
More significantly, the FCC declared that use of small dish
antennas and television receiving antennas can not be restricted
by "any private covenant, homeowners' association rule or similar
restriction on property within the exclusive use or control of
the antenna user". Under the federal pre-emption, all homeowners
must be allowed to install TV antennas. Longer term this ruling may
have important ramifications for eliminating restrictions on Amateur
Radio antennas.

The complete story is available at Ham Radio Online at:
http://206.13.40.11/
(we are waiting for InterNIC to get our domain name pointed at our new
server).

The best thing to do is throw the pk88 away or sell it and get a TNC with a Carrier Detect. You will find the pk88 performs very poorly and will soon get discouraged. Get a Kantronics or even an MFJ. You will be much happier.

: than 1,000 watts ERP (that's your output power minus feedline
: loss and plus antenna gain), you're probably Ok. You'll need to

This is a bit misleading Gary. It should be output power, minus feeline losses, multiplied by the antenna gain. For example, 150 watts out of transmitter, minus 10 watts feedline loss, is 140 watts at the antenna. If the antenna has 10 dB gain, then the ERP would be 140 times 10 or 1400 watts - which is too much.

So much for encouraging better antennas, rather than high power linears. There is now little reason to use an efficient antenna - as the penalty is the same either way. It is much easier to install a linear than a good antenna system.

Of course, you could limit the power under 50 watts, and install a very good antenna. However, I wonder if you would have to have a station that was incapable of greater power output?

I suspect that the new directive is only going to make a bunch of Hams lawbreakers.

> Does anyone on this group have guidance on recommended minimum spacings?
> Is the old ARRL "1 mile or more" rule still valid?
>
> 73 de Jack - N7OO

It very much depends on the frequency separation. From past
experience two systems running 600 KHz separation on the same site
with separate antennas need a minimum of 1 good quality BpBr filter (40
dB notch)in each system to work reasonably. At 80 kHz separation,
nothing but a long string of Hi Q notch filters on each system would keep
them isolated. Only notch filters have the sharp notch necessary to
filter out a signal 80 kHz away without too much insertion loss. And
then only when lightly coupled with a 10-15 dB notch for each filter.

Isolation between 2 vhf systems at 600 ft horiz separation is about 60
dB without cans (guess that at 100 ft is probably 30 dB or so).
According to a data sheet from a filter manufacturer, you need way more
than 100 dB isolation at 80 kHz separation (actually the data sheet
topped out at 100 dB required attenuation at 280 kHz separation.
Extrapolation of the graph suggests that 130 dB necessary attenuation
might be appropriate at 80kHz.) Subtracting the 30 dB isolation due to
horizontal spacing would still leave 100 dB required isolation (+ or -
10dB in IHMO)that would have to be supplied with filters.

Tell the other party that they had better go back to the drawing board
and do their homework. They obviously do not have the vaguest idea of
co-site radio requirements. They are dreaming in Technicolor if they
think they will not cause interference to your system.

It might be the manufacturers will have to apply a warning label on equipment to remind the installer / user of the possiable electromagnetic radiation problems of improperly installed equipment.

Kind of like warning label " Danger the coffee in the cup is hot and may cause burns if spilled upon yourself "

We will all learn about the EPA requirements for radio transmission and radiated power. I know manufacturers cannot build a handheld that transmits over 7 watts RF power with out going through MAJOR EPA loops and hoops. No body wants to go through all of what the EPA requires for handheld over 7 watts in power, so they do not build them.

I would guess this might also be a good case for antenna heighth. The higher the radiating element the less signal affects the immediate surrounding area

Ed,

The article on your web site " The following is the text of the FCC 96-396 R/O. Was that straight from the FCC or your interpetation of what the FCC was saying ?

I do not think just not having to file a EIR is a victory or sigh of relif, but the intemt of the FCC to require and make the amateur responsiable for proper knowledge and proper installiation / operation of his equipment . This would include his being resopnsible for not exceeding the EPA guidelines for RF exposure limits.

By mere addition of these questions on a test, you are made aware that the government assumes you know about these limits They would most likely hold the licensee responsible for operation with in the EPA RF Exposure limits. This could turn out to be be a major turning point in Amateur Radio.

Recently in Seattle, Wa area some brought a cellular phone company into court to keep a tower out of the neighborhood, although they group lost, still the legal battle was on. I for one will keep a weary eye to the FCC and EPA about my Amateur Radio operations, also will have another look at my station installiation.

>Jeff Wright, KC5NEZ
>wright@onramp.net

I am not familier with Winlink, but if sounds like it is sending some sort of "init" string to the TNC. If Winlink is modem software, go to the init and/or modem setup, and change the init string to nothing, or some TNC command if you like. I have mine connect to my PBBS when starting on some modem software that I have.

Hope this helps, take care.

ssment" >>better known as an Environmental Impact Report regarding their Amateur >>station operation.

In essence, the FCC is relying on the demonstrated technical ability
and proven self-policing track record and allowing amateurs to perform
their own evaluations. If we determine that our stations are in
comliance with current FCC regulations, we need not file anything with
the FCC. The FCC goes on to say that stations that run less than 50 watts
do not need to perform the self-evaluation but are presumed to be in
compliance.

The VAST majority of amateur stations are already in compliance with
these rules. Those few stations who determine that they are *not* in
compliance are expected to correct the situation or to file the EA as
described in Part 1 of the FCC rules.

The FCC then goes on to say, "We want the licensees of such stations to
provide adequately for RF safety. We do not believe, however, that a
detailed EA or other routine environmental filing is practical or
necessary. . . An EA would be evaluated by the Commission to determine
whether the authorization should be granted in view of the environmental
impact. In reality, this leads to a de facto compliance requirement,
since most applicants and licensees who are not categorically excluded
(see above) undertake measures to ensure compliance before submitting an
application in order to avoid the preparation of a costly and
time-consuming EA. For this reason EAs are rarely filed with the
Commission. This has not changed from the existing rules. "

>This could get real interesting. Since the article says the station >location and all occupants are in a controlled enviroment. T=
hey >consider neighbors and such to be uncontrolled. I wonder what will >happen if a neoghbor comes down with some mysterious illne=
ss like cancer >and notices he has been bombarded with electromagnetic radiation from >your station all these years could he hold th=
e operator liable because >he had knowledge of the EPA guidelines of RF radiation?.

This could happen right now, before these regulations are in place. A few hams have been sued, and a few local regulations were attempted, on these grounds. In those cases, most hams have NOT had an easy way to demonstrate that their station did not exceed the limits specified in recognized standards. Nor did those standards have the force of law. With the new FCC regulations, and the upcoming material being prepared by the FCC, hams will have regulations that limit the amount of energy they can radiate into their neighbors homes (IMHO, with a presumption that anything less than the allowed maximum is presumed to be safe), and, more importantly, a tool that will allow them to demonstrate that they are in compliance with the regulations, using OST Document 65 (being revised to OET Document 65) referenced many times in the Report and Order. I have to suspect that we will be better off this way.

>Also I wonder what the FCC intends to do with all the land mobile >equipment as most all is 100 watts. The article implies a mobil=
e >station operating over 50 watts could also not be in compliance with the >guidelines..

The FCC covered that in paragraph 67:

" 67. Although our exposure criteria will apply to portable and mobile devices in general, at this time routine evaluation for compliance will not be required of devices such as "push-to-talk" portable radios and "push to talk" mobile radios used in taxicabs, business, police and fire vehicles and used by amateur radio operators. These transmitting devices will be excluded from routine evaluation because their duty factors (percentage of time during use when the device is transmitting) are generally low and, for mobile radios, because the antennas are normally mounted on the body of a vehicle which provide some shielding and separation from the user. This significantly reduces the likelihood of human exposure in excess of the RF safety guidelines due to emissions from these transmitters. Duty factors associated with transmitting devices that are not "push-to-talk," such as transportable cellular telephones ("bag" phones) or cellular telephones that use vehicle-mounted antennas, would be generally higher, and we will require that these devices be subject to routine evaluation for compliance with general population/uncontrolled MPE limits. Although we are not requiring routine evaluation of all portable and mobile devices, under Sections 1.1307(c) and 1.1307(d) of the FCC's Rules, 47 CFR 1.1307(c) and (d), the Commission reserves the right to require evaluation for environmental significance of any device (in this case with respect to SAR or compliance with MPE limits)."

Now, back to writing the detailed report that my boss is making me write.

4179. winlink kpc-3 problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-07 00:00:00 UTC
From: wright@onramp.net
Message-ID: <wright-0708960704110001@jbw.csbsdal.org>
Source record: 35325

I have just upgraded from Aplink to Winlink, and am having a problem. When I first start Winlink, instead of getting the usual copyright information, I get garbage, followed by the "? eh" lines from the tnc. CONOK is OFF, but if I turn CONOK on, the tnc and software work fine. If I turn the tnc off and then on, it gives the copyright notice legibly.

Any ideas on why this is happening? I have checked all of the settings in MBBIOS, Winlink, and the TNC and they all look okay.

If I close Windows and start Aplink, it runs fine. What am I missing?

All,

I have the following for sale.

1) - Kantronics DataEngine with 1200 and 9600 modem installed
2) - (2) Tekk 9600 Data Radios both on 441.000 (one 900 and one 960)
3) - Alinco 1200T 2m 1200 baud radio

Cabling for all of the above to work together, all you have to do is plug into PC and hook up all of the cables and you are on the air for 440/2m 9600/1200 baud packet.

I have a power cube for the Tekk's that also has signal strength when connected to the 960 Tekk.

Sold indivudually this would cost well over $1000.00, I'm looking for $500-600. Offers accepted. Please email to ne1h@ne1h.radio.org or reply to this message

This stuff wont last long, it has been in service on a tcp/ip gateway and I just moved and the gateway is no longer in service. It is all in excellent working order and very clean. Have all manuals and will pay shipping.

I would like to keep it all together if I can, it makes it easier to ship and deliver.

Thanks,
Alan Adamson

Paul Bastian <pbastian@sprynet.com> wrote:
>I have a 286 computer that I use to recieve HF FAX on. Is there any software
>that uses a HamComm type interface that can pick up SSTV.

There are loads of SSTV programs that use a HAMCOMM-type interface:
EZ SSTV, JVFAX, MSCAN, ProsKan, GSH-PC, VESTER, etc.

Some definitely require a 386 or later but some of them
might work on a 286.

You can find more information about SSTV at
http://www.ultranet.com/~sstv

SSTV is the most fun I've ever had with Ham Radio.
It is a mystery why so few participate in this mode.

John

I am aware of a few. TASCO in Japan makes at least one model, but they
are not readily available in the U.S. PacComm has two small
battery-operatied models, the PicoPacket and the HandiPacket. You can
contact them at sales@paccomm.com or (813) 874-2980.

: >
: > 73 de Jack - N7OO
:
: It very much depends on the frequency separation. From past
: experience two systems running 600 KHz separation on the same site
: with separate antennas need a minimum of 1 good quality BpBr filter (40
: dB notch)in each system to work reasonably. At 80 kHz separation,
: nothing but a long string of Hi Q notch filters on each system would keep

: them isolated. Only notch filters have the sharp notch necessary to
: filter out a signal 80 kHz away without too much insertion loss. And
: then only when lightly coupled with a 10-15 dB notch for each filter.
:
: Isolation between 2 vhf systems at 600 ft horiz separation is about 60
: dB without cans (guess that at 100 ft is probably 30 dB or so).
: According to a data sheet from a filter manufacturer, you need way more
: than 100 dB isolation at 80 kHz separation (actually the data sheet
: topped out at 100 dB required attenuation at 280 kHz separation.
: Extrapolation of the graph suggests that 130 dB necessary attenuation
: might be appropriate at 80kHz.) Subtracting the 30 dB isolation due to
: horizontal spacing would still leave 100 dB required isolation (+ or -
: 10dB in IHMO)that would have to be supplied with filters.
:
: Tell the other party that they had better go back to the drawing board
: and do their homework. They obviously do not have the vaguest idea of

: co-site radio requirements. They are dreaming in Technicolor if they
: think they will not cause interference to your system.
:
: Burt>>>
:
All very good points!

I have to question the need for two nodes on the same site. Is there really enough traffic to justify two nodes? If so then you should consider this low cost alternative:

If you really have to have two nodes on the same site then you can increase your isolation by using a corner reflector antenna. Set one node up as the East LAN (or North, or whatever) and set the other one up as the West LAN. Since your corner reflector antennas will be opposing 180 degrees you will have maximum isolation. By using high gain antennas of this type you may also be able to reduce transmitter power which will help things a bit.

As far as determining the actual isolation: The theories and math are great while sitting in the armchair at home but in the real world you need to measure it and experiement to know for sure. Measure the effective sensitivity of your reciever with and without their transmitter running and that will tell you for sure if they are interfering with your signal. Packet is no different than any other communication you will find on 2 meters or elsewhere. It is just as easy to check for desense on packet as it is on FM voice. If the desense is more than you can live with then play with the antenna locations and/or filters.

While I can understand that LAN's do become congested, I find it very hard to believe the need for two LAN's at the very same location. Moving the newcommer to a different, nearby site will give it a similar coverage area. But that coverage area will be moved enough that it may serve other customers the the origional LAN doesn't cover.

It sounds to me like your problem is a simple one. Before you go spending a lot of money on filters, or time moving antennas around, I think that your problem would be best solved by looking over your goals again to determine whether different locations or split coverage areas would solve the problem.

In response to N6GN's question about receiver board schematic errors:

Oh, I found more than those 3 errors... I emailed you (N6GN) a list of the ones I found, but your machine, sr.hp.com, seems to be down as far as I can tell (ping, traceroute, etc..)

Oh, and while I'm here, can anyone tell me how I can get 75 and 100 nH inductors for this project? Do I have to wind them, or can I buy them? I looked through Digi-Key's August catalog, but the only 75's I could find are surface mount....

Thanks.

- John (N3IFG)

There are different level 3 protocols in use, so you will first have
to specify 'which net'.

I *did* just get the mail. My machine is behind a firewall which is the
reason you don't find end-end IP connectivity with it. Your list
seems to be of differences between the layout/assembly information
on the web pages and the schematic(s) published by the ARRL. It appears
that the differences are all "errors" of the layout rather than the
schematic.

> presumably for the microwave board but isn't on the
> schematic
>
> There might be more; I haven't checked everything yet...

These all seem to be issues specific with that particular (older) ARRL
layout.

(1) both devices are the same 2n2222 so it doesn't matter anyway
(2) schematic is correct
(3) dual opamps in the same package. Doesn't matter.
(4) I think this was changed at the ARRL when they (re)laid the board.
the schematic in my 1991 Handbook shows things OK, as far as I
can tell.
(5) It's labeled U8 on the schematic I have.
(6) It appears to be shown correctly in the Handbook schematic.
(7) The ARRL layour used a different connector type but on the one
set of their boards I loaded, both the rx and uwave ends are working

with a ribbon (soldered, not connectored) between them) I think this
was done because they didn't have the connectors I used available.

Perhaps someone who has assembled a transceiver using the FAR Circuit
board set can comment. I have never even seen any board sets except
the early ones from the ARRL. The original four transceivers I built
were all hand wired. I did load and test the ARRL board set though and
it worked, with a couple of corrections. I believe that the corrected
schematic (corrections as listed on the web page) is suitable for making
all necessary corrections to the Handbook schematic. If this is not the
case, I'd appreciate hearing about it.

Thanks for taking time to list these, I don't know if anyone else is
presently trying to use the layouts to build their own boards. Perhaps
they can comment on any other corrections to that artwork.
If more are found, please indicate and I'll put them where everyone can
see them.

Has anyone had recent experience with the FAR boards or other layouts?

For personal mail (not bulletins) Packet traffic via satgates--->
satellites is really fast .My personal experience is traffic between
Britain and New Zealand ,with a reply being received within 30 hours.
Packet traffic via satellite within Europe is nowadays quite common,
even between Britain and for example the Netherlands(via a satgate in Belgium)
For personal mail HF packet is not required except to/from a few
African countries. Also traffic to/from the Falkland Islands ,to my
knowledge, can only be handled via HF.
Zimbabwe however can be reached via a satgate in South Africa
Intercontinental Bulletin traffic however are usually handled via HF
packet or via non-radio routes.

Does anyone know off hand if they are using the IEEE C92.1 limits? If so, Anybody trying to transmit at the normal 100W in a residential neighborhood (ie, low wire dipole antenna) may be in trouble. Forget about using attic antennas. The standard penalizes efficient antennas. I also believe the limits vary wiith frequency; I know that that the allowable ERP at 800MHz is only about 0.4W, compared to the previous 7W Max. transmitter power (the old standard did not consider antenna efficiency). I also know that 800MHz products designed well below the 7W transmitter power level usually did not meet the 0.4W ERP or that other parameter, SAR (for products held close to the ear). Yes, our handheld devices may be exempted but my point is that, if FCC is using the 1992 IEEE standard, amateurs in residential areas (a large portion of the ham population) will at the very least be marginal at 100W, if they use wire dipoles, G5RV's, slopers etc., and I believe the small 600W linears will be out of the question. I hate to sound like I'm sounding a false alarm but I'm not ready yet to buy into ARRL's contention (D. Sumner) that the new regulation will show how safe amateur installations really are. I'm sure he has a high tower to take advantage of 1/R**2. The new IEEE limits are much lower than the previous standard, but we will not start seeing this until after we start making the measurements.

When you use the term "Gunnplexer" it is in reference to the M/A Comm
trademark (or whover owns it now). The difference between a Gunnplexer
and what N6GN used, is that you use the varactor diode to modulate, not
the DC. This turns out to be way more linear. About all you can do
with DC modulation was about 2 Mbps (maybe, if your lucky). Communications
Quarterly (first issue I believe) had a good 24 GHz design that provided
digital tracking. That way as the carrier drifted all over (as all Gunn
diodes do--temperature stability), the other end tracked it.

If I was going to do RF, this is what I'd use. Get a 200 mW Gunnplexer
and an Omni antenna (available from the San Diego Microwave club I believe,
or whoever the microwave author was/is in 73 Magazine). The antenna runs
about 40 bucks if I remember (unsoldered). Then apply the Communications
Quarterly knowlege. CQ (no not that CQ) was what became of Ham Radio
magazine. Don't know if it's still published.

4205. Remote Internet Connection

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-08 00:00:00 UTC
From: CIN Guest User <guest@cin.gov.au>
Message-ID: <4udub5$ft1@canb.cin.gov.au>
Source record: 35261

I am looking for a system that uses a radio link to enable
remote internet useage. An existing system using a mobile
phone is around, This system has a modem that plugs into your
laptop and the modem then plugs into the mobile phone instead
of your telephone line. But at a dollar or so a minute it is a
bit expensive for net surfing.
With the cheaper radio link option I am researching I would
have the radio link inbetween the car with the laptop and my
house with the phone line. The phone line would be connection
to the internet, and the radio transmission link enable
computer mobility at an affordable rate.
I,ve heard of packet radio and am not sure whether this
could be adopted. 14,000 baud would be a minimum transmission
rate (I need enough speed for the pictures etc. of webpages).
Also I was wondering what frequency I should use for a good
range (city suburban area) and high transmission rate (
perphaps up to 64kbs.

Could responses be to made to my email address and as usual the
newsgroup.
Thanks

Hans Hochwald

It is worth pointing out that the FCC standards are from the NCRP and they represent a total exposure over a six minute period. As long as you are running HF sideband (or heaven forbid --even morse) your duty cycle is such that you will not be likely to get a continuous six minute exposure.

Remember that a sideband signal's average power is typically 1/4 of the PEP and that unless you are quite chatty (the FCC thinks we'll transmit and receive 50% of the time) you are unlikely to hit the limits of your exposure at 100 watts. So my Kenwood TS-50 will likely still meet the standards set by the FCC even though I typically run 100 watts. As for how I'm supposed to document this and where I'm supposed to file this report --that has yet to be determined.

Having been a ham for 20 or so years, wearing a ham HT on my belt for a good portion of that time, and wearing a commercial HT on my belt during working hours for several years, and for the last 6 months undergoing chemotherapy due to lymphoma (which is, interestingly, cancer of the lymph nodes located in my abdomin, near where the HT antennas were located), I don't think I'll get too excited if I have to document compliance with a regulation designed to lengthen my life.

Cancer isn't any fun.

Sure, I know I'll get flamed, because I don't _know_ that the cancer was caused by the HT's, but then again, I don't _know_ that thay _didn't_ cause it.

I use JVFAX (version 7.0) on a 286 machine using a HamComm interface.
My PC only has 1Mb of RAM and can't store SSTV images to disk but images
are displayed as received, fine. 1 Mb is fine for storing FAX images from
JVFAX.

hth,
P.

4215. Pocket TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-08 00:00:00 UTC
From: ianj@pogo.wv.tek.com
Message-ID: <4ubbum$g32@gazette.wv.tek.com>
Source record: 35347

I am a relatively new amateur, and I'd like to get into packet radio. As it is, I have a radio and a computer (well, ok, i'm a programmer by trade, so I have a few computers), but I lack the TNC.
One of my computers is an HP 200LX, which is a palmtop computer. I regularly carry this computer around, and also regularly have my HT with me. I was thinking that an ideal first TNC might be a pocket-sized, battery-powered unit that can interface my palmtop with my radio. (The HP 200LX is a DOS-based 80C186, for your reference.)
I read an article on this a few years ago in QST, but have long since lost the magazine. I know that the author of that article used an 'off-the-shelf' TNC, and now that I'm considering it, I'd really like to know what it was.
Does anyone know of a commercial TNC which is battery powered, and is fairly small?

I have heard of BayCom packet software, but I have a small problem with that package: I've found three circuit diagrams, and have no clue which one is 'correct,' or if they're all right.
The first schematic I looked at was the one called TCM3105.PS, and looks like it was composed by DL8MBT/DG8RBU. This appears to be the simpler circuit.
The second schematic (which I can't find at the moment) is vastly different, and appears considerably more complex. This was presented as a .gif file at an FTP site which carried the BayCom software. (Not baycom.de, however.)
The third diagram is one which I got off the BayCom site, and which I would normally consider 'right' except for the other two pictures. This is called 'anst.ps' and is a superset of TCM3105.PS (it contains some additions).
If I can figure out which schematic is correct, I am happy enough to build something myself (I've had experience building circuits before). Basically, I need some help on which circuit will do the expected job.

Anyone who can help me in my quest is encouraged to send me mail or leave a message on the newsgroup. I imagine I'm not alone in this quest, so perhaps posting to the newsgroup is better.
Thanks for any help you can provide.

From: reebr@minyos.its.rmit.EDU.AU
Message-ID: <4uc358$s9p@aggedor.rmit.EDU.AU>
Source record: 35348

I am trying to receive SITOR mode A(ARQ) and B(FEC) using Hamcomm3. The
coast stations I am tuned to are ones like KFS, ZLA, VIP, KEJ. All I seem
to get are strings of messages saying TIF... TIF...
This occurs during the times the station is idling and sending out its
call sign. When messages are being sent, I see nothing on my screen. I
believe I have correctly tuned but maybe the problem is in timing.
I have tried both FEC and AMTOR lIsten modes.
I have no trouble receiving BAUDOT and CW.

Can any one help with SITOR reception please

When I first started in packet (1987) I did so with the desire to chat locally. The most popular mode was Unproto and a digipeater. Then there was the BBS, NetRom, and TCP/IP. Of those I found NetRom to be fun, as I went node hopping and listing the local users etc. As I came to know what was available, it was fun to connect several states away. It wasn't fast, but it was interesting. TCP/IP has always been my favorite mode, but it has stagnated. The developers are spending all their time turning it into a BBS. I then tryed the BBS system in place back then. As I look at BBS systems today, they are basically the same. No real progress in the user interface. Many BBS's still forward on the user channel. Many still operate at 1.2 kbps.

The issue is quantity of data, and the user interface. Not many people want to manually connect, type all these wierd letter combinations, and receive 80 character line listings. Messages over 20 lines get deleted because "they are too big!!" etc...

I propose within the next 10 years that the BBS people design something for the educated people of society, rather than concentrate on the lower class. Most Hams are now equipped with systems having a visual interface (Windows, X, etc). There also needs to be an automated feature which notifies the sender that the message did not go through. Each forwarder should report rejected messages to the neighbor. What good is a system that doesn't reply with a receipt. Especially one that would be used in an emergency. I'm not talking about bulletins. Those should be highly filtered (judging from what I see), but real messages should have an end-to-end acknowlegment (at priority).

Exactly! What about hospitals (where one goes to get healed supposedly) and their 5 kilowatt ERP pager antennas? I'm serious, I've seen the specs required by some hospitals here in Md for their paging network. Not to mention commercial pagers.

Like the new bogus stricter vehicle emmissions laws, if you don't meet EPA requirement you have to pay waiver penalty (in Maryland, $150 for 2 years).

Sounds like another money-grubbing scam from Washington.

In this thread there has been mentioned of the FCC study on this issue. A number of months ago I downloaded this " article " for work it prints out to be over 70 pages. We have nbeen looking at this issue for a while now casually. It was worth the time to download , lots of information was surprized to see how many typre of antennas the FCC used for testing and the tables and charts with test results included..
Download and print it today. Take a few nights to read and digest it.

You'll get a T1 connection which you could attach to your router.

I hope you don't consider the school application too critical.
Remember, part 15 devices must put up with any interference they
receive. Not only that, if you happen to interfere with anyone
else, you can be requested to shut down.

I have looked at the early lynx receivers. What they do is add
their own PN code at about eight times the data rate. That in
itself wouldn't be a big deal, except that the receive side is
wide open. They use a very wideband discriminator to receive
the whole FSK PN+signal mess. Then they digitally xor
themselves with the incoming PN signal. It will work, until
some stronger signal appears anywhere in the passband. Then
the discriminator goes in to capture and you're screwed.

Lynx is relying on the very low activity in the 2 GHz band to get
away with this stupid trick. That situation is likely to change
soon. If you expect PCS to show up anytime soon, you had best
avoid this stuff...

Yeh right, what planet are you from ? As somebody who has been through
many zoning restriction tower "battles" this whole EPA bull will be used
as just another tool to prevent us from putting up efficient antennas.
Been there done that. If I didnt have a decent tower now (which probably
is worthless with these new restrictions) I would NEVER go through the
hassles again.

There are some monolithic VTO devices, packaged in TO-5 like cans, available from Avantek. I'm sure Plessey, Mullard, and other European suppliers have something similar. I found a surplus one in the 1-2Ghz range. The data sheet indicates that they are available up though 11ghz or so. I do not know what Avantek gets for them. They look fairly easy to integrate and phase lock. I wonder if your couldn't pull a DRO around a bit with a varactor?

4232. Minimum frequency separation at 2M

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-09 00:00:00 UTC
From: n7oo@azgate.nj7p.ampr.ORG
Message-ID: <9016@NJ7P>
Source record: 35278

Thanks to all who took time out of their busy schedules to answer either directly, or via the reflector! Since this is a topic not encountered often, a summary of comments are provided.

The original question concerned the feasibility of operating two transmitters within 80 KHz and 100 feet separated from each other. I asked this question on both the digital and homebrew groups. The responses were unanimous that NO, this is a poor idea and several followed with horror stories confirming this conclusion.

The engineering approach to make a determination in this type of situation is to calculate the signal strength of the interfering signal that will be present on the other receiver. To do this, one needs to know the power outputs, antenna gains, transmission line losses, and free-space path loss.

In our original example we assumed the power output to be 5 watts and both antennas to have 5 dB gain, with a total of 2 dB loss by the respective transmission lines.

Free space path loss = 36.6 + 20 log D + 20 log f

where D is the distance between the transmitter and receiver in statute miles and f is the frequency in megahertz.

(For those of us who don't have access to a scientific calculator, the CALCULATOR program in Microsoft Windows is adequate to handle the task)

Converting the 100 foot distance into miles: 100/5280 = .019 miles.
The frequency = 145 MHz.

Path loss then is 36.6 + 20 log .019 + 20 log 145 = -45.4 dB.

Converting transmitter power to dB, 10 log 5 watts = 7 dBW. Changing dBW to dBM for easier conversion: 0 dBW = +30 dBM +7 = +37 dBM.

The estimated two antenna gains = +10 dB.

Interfering signal level equals gains (+47 dB power) minus losses (2 dB coax attenuation plus 45.4 dB path loss) or, -.4 dBM. According to the attenuation dial on my old HP-608C signal generator, -.4 dBM is equal to 200 millivolts signal level.

At this point one can compare receiver specs as to rejection to off-frequency signal levels. A typical dBM level for weak signal quieting would be -107 dBM (approx 1 microvolt). Our example receiver then, would have to be designed to withstand a signal level in its front-end that's 106.6 dB GREATER than that for 20 dB quieting!

To put this into a more familiar perspective, high quality duplexer cavities as used on 600 KHz repeater spacings typically have rejection notches between receiver-transmitter frequencies on the order of 100 dB. One would then anticipate desense on unfiltered radios with 80 KHz and 100 feet separation.

The ultimate proof is of course to perform on-site testing. This was done this past saturday. No desense our our receiver was noted! How can this possibly be? Obviously anything close to 200 millivolts of signal level wasn't present at our receiver. I didn't verify that the other transmitter was putting out 5 watts, or even that their antenna was connected during the test period. But assuming conditions were as stated, the only other explanation is that normal coupling wasn't present between the two antennas.

Does this mean that it's OK for the state coordinator to authorize use of such close frequency and proximities, even if interference isn't initially noted? Definately not for the following reasons:

First, any changes in power or antenna locations at one or both sites could very well induce interference. Thus such coordination is like a land mine, just awaiting disturbance before going off!

Second, the users running home XNOS stations gatewaying between 144.93 and 145.01 will NEVER be devoid of mutual desense between their ports. Not only will the gateway stations experience a hit on throughput, but this inefficiency will be reflected back onto the respective networks, creating problems for other users as well.

Because of this undesireable situation, I'd recommend that frequency coordinators be required to have a reasonable knowledge with the RF technology involved. I'd also recommend that he provide a 30 day notice to existing site operators, identifying the new frequencies, sites, predicted antenna gains and power levels being requested. He should also be available to provide technical guidance to site operators.

The frequency coordinator should also have available for guidance, all voice and data frequencies coordinated for any given site.

Regarding the use of cavity filters to trap out close spaced frequencies, one should consult the typical filter curves and charts given in the catalogs of those that provide cavities. There are definate limitations as to how close one can notch out adjacent frequencies without suffering undesireable attenuation to YOUR channel frequency. One example in the DB Products catalog shows an 8 cavity duplexer being a practical limit for 300 KHz spacing.

As for a general guideline on physical proximity, for close channel spacings, someone suggested that a calculated signal level of -25 dBm (11 millivolts) be a practical limit. This would take into account variations in distance, power levels and antenna gains between sites while providing reasonable immunity to desense.

I applogize for the length, but hope the above has provided some understanding on this topic.

Of course you don't HAVE to buy a gunnplexer: It's much much more fun to make
one. Together with a friend (PA3FWM) I did so a few years ago. We were trying
to build a super-fast interlink, like everybody else. But instead of ordering
an expensive 'plexer, we ordered some 5$ Gunns and Varactors from a surplus-
supplier, with some brass waveguide. Sawing, grinding, polishing, learning
how to use a lathe, and fighting with teflon-tape.Lots of wasted time, fun and
three prototypes later, we had a working gunn-oscilator, that could even
be modulated by the varactor for a short time. Alas, the varactor and gunn-
diode went the way of most old semiconductors, and died of static electricity
(or whatever else we did wrong to them ;) and the project has become an
excellent dust-gatherer since, because we cannot find the varactors anymore.

So what I would like to know: Is anyone here aware of a design for a 10GHz
transistor oscilator with varactor modulation on stripline? We'd like to
modulate and phase-lock it, so we don't walk all over the X-band.
Schematics and board-lay out would be even more appreciated (Scans?) as it
might be a bit hard to get USA-magazines over here.

Regards, 73 de PEaNUT, Paul.

I would agree with Ron that in an area that doesn't use a two frequency digital repeater it is certainly better to have a tnc that uses a Data Carrier Detect, this can be added to most TNC-2 clones. I've added them to older MFJ1270s, which is quite easy, and to a PacComm Micropower2, similar to a Tiny2. This was a bit trickier however it works very well. The kit to add this used to be avaiable from TAPR for a pretty good price. I'm sorry I don't have contact info handy. One might also be able to pickup a newer version of the TNC's operating firmware. If I can be of more help please post or better yet e-mail or packet me. 73 John VE6OTC

Subject: Re: article

Phillip,

Below is a text version of your article. Thanks for contributing
it to the Palmtop Paper.

Rich Hall

*** Article begins here ***

*Using the HP Palmtop
with a Ham Radio

This user connects his Palmtop
to other computer systems via a Ham Radio.

By Phillip Nichols

About the author: Phillip has been interested in computers since he purchased his first computer, a Commodore Vic-20. He spent his Junior year in High School as a teacher's assistant in his school's first computer class. Since then, he has used his personal, palmtop, and amateur radio skills to help others, spiritually and otherwise.

Recently my notebook PC took a trip to the doctor; maybe it was a vacation since it was gone for almost two months. My computing was done solely on my HP 200LX. It so happens that at about the same time I received my FCC license for Amateur (Ham) Radio. (I had the urge to try Ham Radio, studied from scratch, aced the test, and waited around for the license).

All right! My license came in (KC8DQF)! Now I could "boldly go where no-one has gone before...," or at least where I'd never gone. I immediately wondered if I could tie my Palmtop into the radio for wireless work. I read about something called "Packet-Radio" -- a way of connecting computer systems and networks by means of Ham radio. Then I saw an ad for a "packet modem" that plugs into a computer to convert it to a TNC. A "Terminal Node Controller" is what Ham operators connect to their radio for the digital/analog conversion of the computer data as well as for providing error

correction protocol called AX.25.

You need the right stuff

The packet modem was the BP modem by Tigertronics (1-800-8-BAYPAC). It comes with special communications software and the modem (a small 2-inch-square custom analog/digital modem based on the old Bell-202 standard). The BP draws 9ma of power directly from the serial port of the computer. No external power supply for the modem is needed with a standard PC. The general advice with a Palmtop is to use an AC adapter when connected to a modem. However, I find that the BP modem does not significantly reduce battery life and don't bother with the adapter.

The final piece of hardware in this setup is the actual radio transmitter/receiver (a RadioShack HTX-202 Transceiver). I prefer this radio because it does not allow Wide receive 108-174Mhz. What this means is that it is less bothered by what is called "Intermod" or interference from ghost signals "mixing" with Ham signals. This is important in choice of radios for this type of work. Now the question was: "Can I hook all this up to my HP Palmtop?"

Getting it all to work
with the Palmtop

Sure enough! I fiddled around and got it all to work, and then discovered that someone on the web has done the same thing with the exact same equipment (minus the antenna). So now there were at least two of us using the same Palmtop/packet radio combination. Now I could really send and receive "airmail." Although I use this system mostly at home from a desktop PC, the fact that it works with the Palmtop means that I can logon anywhere. Even from inside a shopping mall or at work.

I physically connect my Palmtop to my wireless transceiver using my packet modem. Previously I have loaded the necessary software drivers on the Palmtop so that it can communicate with the modem. I start the Packet radio communications software on my Palmtop and type "connect" followed by the call letters of the person I want to communicate with. It's that simple.

Each packet radio area will probably have many PBBS's (Packet Bulletin Board Systems) running a newer communications protocol known as JNOS. This protocol is similar to an Internet TCP/IP protocol in that it lets you communicate with packet radio addresses that are not in your immediate area.

Once you establish connection, you get a menu just like a normal BBS menu. There are up to 30 commands you can access, so there is a lot you can do depending on what BBS you connect to. As with Internet, Packet BBSs let you "telnet" (link) to other sites in neighboring counties or states. You can even send files by radio, although 1200 bps is a bit slow.

Another user's story

Jason Baack of Maine, the other person I mentioned that uses this setup, told me how he got started.

"I was first introduced to packet radio two years ago on Rainbow Lake in northern Maine (U.S.A.). The total permanent population for the area was listed as four, living in a township called 'T2R11.' There were no roads into the lake, (you had to fly). Three 1.5K generators provided power during the daylight hours, so I was able to use my ancient Packard Bell 286. I got my Ham operators license while I was up there, got a wave antenna and other necessary equipment, and had a blast the rest of the summer connecting to DX nodes, the far reaches of Canada, Nova Scotia, and talking 'keyboard-to-keyboard' to some local (20 miles away)."

Jason (call sign N1RWY) has plans to contact the Mir space station someday from a nearby mountain, while I, though no less adventurous, am stuck in the flatlands of Michigan. I am planning to operate a land-mobile packet station while I ride on vacation trips this summer and also would like to find a pilot at a nearby small airport willing to try a little air mobile to see how far I can QSO (Amateur Radio communication on the air) with another station.

As it is now I can hit a packet Bulletin Board Service near me and get mail, topical groups, and telnet to other stations that may otherwise be out of my power range. There is even a World Wide Web/IRC-style conferencing area called CONVers for communication with other "packeteers" around the United States. And finally there are Gateways that tap directly into the Internet to speed things up.

Amateur Radio:
A hobby that's fun and helpful

Amateur Radio operators and clubs perform services by providing communications in times of disaster (both natural and man-made) and sending messages from non-hams to people around the globe that they may have lost contact with! Ham operators seem very interested in helping both the ham and non-ham. One fellow ham gave me an old receiver to help me improve my Morse-code abilities so I could communicate over world-wide frequencies. He also gave me 26 back issues of QST, a relevant Amateur Radio magazine. Another Ham is going to help me improve my antenna.

[Note: QST is a publication of the Amateur Radio Relay League (ARRL). Call 1-800-326-3942 for information on becoming a Ham operator as well as joining ARRL. Membership includes the monthly QST magazine. They also have a NEW-HAM kit, which they'll give you free of charge (no membership required). It's their way of introducing you to their services and getting you started in ham radio. I also received an offer to receive a free Ham-related book.

I chose Hints and Kinks from the list of titles. It contained a lot of little fix-it tidbits good for new Hams to know before hand, like how to mount your first antenna on your car without destroying your car in the process.]

Amateur Radio Clubs also get together monthly and have special activities for both fun, as well as some that help emergency preparedness for the community. An example is the Amateur Radio SkyWarn system that tracks severe weather and reports it to local weather services. In Ontario, Canada; I have met some who chase and report on storms as well.

Amateur Radio provides you with the opportunity to experiment and challenge your own personal limits. In addition, it lets you give something back to your community. I definitely stretched my Palmtop's capabilities, but there's more room to grow. With my HP Palmtop I can run satellite tracking programs to locate Amateur radio relay satellites in "real time" using REAL95.ZIP <contact info at end of article>. I have another TSR program I run while on packet that can help locate and calculate the distance between myself and the ham on the other end (GRID.ZIP <contact info at end of article>). I have modified a Palmtop-database for keeping a log of my contacts (ARS-LOG.ZIP <contact info at end of article>).

You can investigate ham-related topics by contacting a SIMTEL site on the Internet. Most have an amateur-radio and packet directory listing topics of interest. One such SIMTEL site containing about 100 topical directories is:

http://oak.oakland.edu/simtel.net/msdos/index-msdos.html

Another non-SIMTEL, but more ham-specific site is:

http://www.cdrom.com/pub/hamradio/oak

The more I look, the more people I find using their Palmtop with radio. We hope to "QSO with you on 2meters (144-148Mhz)" sometime, or else exchange some packet e-mail! So how about getting your license? It's now easier than ever to get started, you don't even need to learn Morse-code to begin (but you'll earn more respect if you do). You have nothing to lose, and world of ham operators to gain.

For more information visit Jason's web site at:

http://www.umecut.maine.edu/~baack

or Ham-Radio On-line at:

http://www.accessone.com/~vbook/hronline.htm

Packet radio networks

Ham operators designed their own "Network" of computers back in the late 70s. The Canadian Department of Commerce legalized Packet Radio by ham operators in 1978. Then the TAPR '80 (Tucson Amateur Packet Radio corporation) began developing radio communication protocols. 1981 TAPR decided to use a version of the computer industries x.25 communications protocol, calling it AX.25 ("A" for amateur radio). Packet radio communications started with a few people who could afford computers and to modify Bell-202 modems with the TAPR chip protocol.

Soon computer prices fell and Terminal Node Controller kits were becoming more available. Radio networks were being set up much like a unix "on/off LAN" and businesses "constant-on LAN." An example of an "on/off LAN" is an Internet web browser, that is not actually connected to the web site all the time, but intermittently connects to ("pings") the web site for information. A computer bulletin board system like CompuServe is an example of a "constant-on LAN" because it is always connected to the net and to other nodes in its system.

Pricing and Contact Information for products mentioned in this article

All prices are manufacturer's suggested retail price. It may be possible to purchase the product for less at third-party vendors.

BP Modems
Model 2 -- $49.95
Model 2M -- $69.95

>>|Andy

I think the idea in so far as enforceability is concerned is so the powers-that-be can have one more thing to hang over your head just in case you do something to displease them.

I am not completely prepared to debate this, nor do I think this is the proper forum(s) to do so in, but I have come to the conclusion that the government has decided that the normal legal / legislative process has become ineffective in dealing with the issues (read: percieved *threats*)

Our politicians spend so much time preening and posturing before the American people, rather than dealing with substantiative issues, that the entire political process has become more of a circus side show, than an exercise in effective government. I am not altogether convinced that the people we elect to office are even qualified to understand the issues, much less deal with them.

So they sidestep the whole issue by creating a multitude of agencies with administrative (read dictatorial) authority over just about every aspect of our lives. These agencies rule by fiat, and in many cases are not accountable to anybody. (Canonical example: The I.R.S.) There are so many rules and regulations, so haphazardly written, and in some cases, mutually contradictory, that I suspect that no matter what you do, you are going to be in violation or one or more. Period. This sets the stage for selective enforcement, which means that if you attract thier (agency) attention, you get stomped on.

This flap over environmental impact statements is just another example of a government spinning wildly out of control.

Unfortunately, I am not a politician, just a humble electronics enthusiast, so what can I do?

Hello !

Some members of our group are frantically engaged in building Dale's GRAPES Modems and the associated transverters to go with them in order to provide some experimental user links in our area.

As part of the experiment may involve a "full duplex" option we'd like to get hold of or build some Gracilis HDLC cards. So far several approaches to Messrs PacComm to purchase have been turned down on availability grounds, and experiments are being conducted presently with Baycom USCC cards.

We'd now like to do our best to construct these Gracilis cards ourselves if the designers permit. Could any kind reader provide any pointers to us as to where we might find the necessary diagrams and equations ? or perhaps even a member of their design team !

73, Gareth.

Check in www.tigertronics.com for their BAYPAC BP2. It doesn't need
any external power and you can use it with your HP200LX.
I am doing the same.

100 Watts ,incredible; but somewhere in that kit there should be a
'3dB down' switch. I am sure nobody will notice such power reduction.....
the result.....half an S-point down .

Most of the existing 900 MHz DS SS systems in use today use 10-12 bit spreading sequences which are symbol-synchronous. These codes are barely capable of providing the FCC-required 10 dB processing gain (under ideal circumstances).

Most are despreading at baseband (broadband all the way down) so they are subject to interference ... some are, as you relate, actually wideband digital FM with limiter-discriminator type receivers, others are BPSK/QPSK with linear receive chains and AGC ... however they are still subject to strong interferors.

Get the kantronics Hostmaster Mac software program. I use it on my powerbook 145 and it works great. There aren't many shareware packet programs for the mac. Savant is one of them but I've never tried it. You should also be able to use a terminal program like Zterm setting it for 1200 baud and be able to connect that way. That's how I first started out until I got the Hostmaster Mac program.

I notice that the PI card web page also has a note (for quite awhile)
about possible lack of availability. PacComm was supposed to take on
the Gracilis line, so this is news that they still haven't got a product
to ship. It looks like the ISA card approach is losing ground.

PacComm would probably want to sell you their Spirit TNC, but I haven't
kept up with whether they ever made the New GRAPES modem combo yet.

At any rate, I wouldn't invest in any card that isn't going to be
around for long, or one that can't be produced in quantity.

The Ham Radio Online web is still "on the air." However, our new web server located in California's Silicon Valley lost power during the massive west coast power outage this weekend and as of Sunday morning (U.S.) 11 August the http web server is still not functioning. Our ftp access to the web site came back up this morning so we've updated the files. We assume the web server will be brought back online by Monday.

You can access the Ham Radio Online web site at:
http://206.13.40.11/
(www.hamradio-online.com when InterNIC gets their directory updated.) You can also check for updates at our backup web address:
http://www.accessone.com/~vbook/hronline.htm

We've completely redesigned the "List of Other Ham Radio web sites", "Commercial Products Directory" and the Ham Radio Online Library for easier access to all the information that is stored online. It really looks cool and we had a lot of fun learning how to use "frames" for the web pages.

Thanks!
Ed, KF7VY

supposed to be a place in alaska that had to dump fishing waste into a stream upstream of a water treatment plant so it could be shown that the addition of the waste treatment plant water would improve the water's quality (had to do with EPA rule requiring treatment plant to improve water quality x%, without taking into account the initial condition of the water or what the water would be like if the treatment plant were not there....). anyone got the exact info on this one?

>> antenna :-)

actually, wouldn't a TV antenna work for 6 and 220 without too much effort?
and 2m might just work on an LP type antenna...will have to see if it's possible
to do some measurements....wouldn't expect there to be too much modification
needed for the use of an existing TV antenna as a transmitting antenna in
the amateur service -- short of adding a balun (6:1 for 300:50 transformation) and
maybe doing some minor changes to the element lengths.

In response to my enquiry as to the whereabouts of Gracilis Packetwin construction / design info Steve Sampson kindly replied:

> I notice that the PI card web page also has a note (for quite awhile)
> about possible lack of availability. PacComm was supposed to take on
> the Gracilis line, so this is news that they still haven't got a product
> to ship.

From my enquiries with PacComms' UK agents Siskin, it seems that they take a block of orders, and then make the cards up to suit. I tried to get an order in a few months ago, but although PacComm had a full order book for a batch, they hadn't got the GAL / PAL programming info in order to produce. The situation might have changed recently, but I don't want to keep e-mailing PacComm's staff (who do reply quickly and in depth) and get a reputation as a pest.

> At any rate, I wouldn't invest in any card that isn't going to be
> around for long, or one that can't be produced in quantity.

I'm tempted by the Ottawa PI2 card, but gather it doesn't do full duplex. One of our members is quite happy to design and make PCBs, and also program the GALs etc. from equations.

Thanks also to Jon for his kindness in supplying a possible lead.

73, Gareth.

>See above comments.
>The delay time is determined by networking constraints, and not at
>all by "store and forward delays". Those delays can be made as long
>as the sysops choose, or as short as the network connectivity allows,
>no matter what protocol is used for the transport.

But the fact is that the store and forward delays are long at nearly
all current PBBSs. Take a look.

Granted this has nothing to do with the protocol, but it is strange
that conventional PBBSs have longer delays than the 7/24 TCP/IP
stations.

>> (B) Allows users to be an active part of the Network.

>As do all the other protocols.

You are assuming that I think this is a good thing. I actually do not.

>> (C) Encourages the development of multiple redundancy in a LAN.

>See above. This has nothing to do with the protocol used.

Again, you make an assumption that is wrong. What happens is that Joe
Blow (if there really IS a Joe Blow, please forgive me!) puts up his
TCP/IP station with NETROM on the air for a couple of hours while he
does what-ever. He then becomes part of the dynamic network. He then
shuts down and goes to bed. For the next several hours, the network
tries to operate through a non-existant station.

>> (D) Allows long distance keyboard to keyboard contact.

>Here tcp/ip has fallen down badly. Long distance real time connectivity
>has never (to my knowledge, and I have been looking for it) been accomplished
>using tcp/ip as the transport.

Depends your definition of long distance. I have done SE-MO to N-CA
several times.

>> (E) The FTP functions offer a dramatic increase in file transfers
>> over 7+, YAPP, etc..

>"Dramatic"? It's the same bits going down the same pipes.

Take a look at the protocols, Hank. To transfer the _same_ number of
bits at a given speed takes a predestined amount of time. The
difference is in the number of bits _total_ transfered.

>> Some of the disadvantages include:
>> (A) Few individuals will leave their station up 24 hours a day, 7
>> days a week. This causes a breakdown of the Network.

>I observe the opposite: the majority of the users I know about leave
>their systems on 24/7 and many run one form of networking or another.

I have not seen an actual study of this. My experience has been the
opposit.

>> (B) Requires a computer to be on, not just the TNC.

>Not true.

If you count JNOS 40 for the Data Engine, you are correct. All others
need a computer.

>> (C) Many NOS systems are hard to set up.

>I'd say "... all ...". And yes, I've tried most of the flavors of NOS,
>including my own personally modified version.

Amen!

>> (D) In many areas, NOS is not well received by the Ham community.

>And in many areas, it is well received. But from my own observations,
>NOS is not at all popular with the large majority of hams.

Around here, running NOS is a good way to get locked out of all but
one of the local nodes.

>> (E) TCP/IP Routing is a mystery to many Hams.

>And to many network experts.

heh!

>> (F) Poor handling of Bulletin and NTS traffic.

>This can be fixed without a great deal of effort.

No one has really done it so far... JNOS and TNOS seem to handle it
best right now, but they are nothing to brag about.

>> TCP/IP and its related functions offer a very much needed improvement
>> in Packet Radio. Things like Telnet, FTP, NNTP, SMTP, and others could
>> offer great opportunities for Hams.

>The hams I have spoken with have never mentions those protocols,

>And that's almost all of them.

I have set up several with the 9612 TNC and TEKK radios and one with a
Kantronics Data Radio. No problems with any of them... Came right up
1st try.

I disagree... With better/faster HF systems, I think that we could
have the same types of riuting as found on the Internet. Note this
would mean some changes to both the rules and attitudes. More in a
later post...

We are very close. I have set up several 9600 stations using mostly
the TEKK rigs and one Kantronics Data Radio... All used the 9612 TNC
and all were plug'n'play. No problems.

What sort of applications do you have in mind? Browsers? Real-time "online" games? (I would LOVE to play MS Golf or Flight Simulator over packet!)

All of this is exceedingly simple to impliment, but at even 9600 bps, you would likely be dead before a game were finished!

Again, thanks! Until we get to the point where we have some small
number of hops between points, we will continue to spin our wheels.

>> (B) Allows users to be an active part of the Network.

>That's certainly a double edged sword. :-)

heh! See your own comments below...

>> (C) Encourages the development of multiple redundancy in a LAN.

>Only if routing is *dynamic*. As long as NOS depends on static
>routing, it is vulnerable to physical changes in the network's
>topology.

These comments, that is... Even on the normal NETROM routes, in this area, people have the habit of "forcing routes" via AX.25, thus defeating the entire purpose of the system.

>> (D) Allows long distance keyboard to keyboard contact.

>Not a chance. Too many hops means that realtime operation is

Aye, that's the rub... Just as the proverbial "thought exercise", think about higher speed HF links... What are the possibilities? A few other ideas follow at the end of this message.

>The model we can best implement is of a fast *local* net
>connected by slower long distance nets which operate out
>of realtime. Fortunately, this meets traffic patterns
>fairly well. Most content is transferred between local

I would be interested in your definitions for the "fast local net" and the "slower long distance nets"... What speeds come to mind when you think of this, Gary?

>> (E) The FTP functions offer a dramatic increase in file transfers

The above comments are, as per your norm, Gary, very well thought out,
factual, and to the point. Thanks for the input!

Now, I suspect I will catch some flack on this as well, but I have a
small problem with Amateur sat. operations... Can someone explain to

me why we have things like Webersat (sends poor quality pictures very slowly) and the several beacon sats? What purpose do this serve? Wouldn;t the AMSAT $$$ be better spent on birds that actually do something and meet a need?

What I am leading up to is the exploration of an Amateur Sat. system to allow very high speed, long distance links. This won't happen overnight and will cost more than the average DX Contester's station (not much more!) but I think it is something to think about. Comments?

Hello,

does anyone know a site where packet software for the Psion 3a is
available?

I would like to use the Psion for "Packet on the move", in conjunction with
my ICOM 706.

Thank you for any advice,

Ulrich M1AJD.

Here is a list that I got off of the B-VARC Home page. It has a few HF
Nets to start you off on.
The ARRL also sells a small book that lists all known nets in the US. Less
than $100 I believe. I have one here somewhere. It has so much in it it,
that it's not very convienent.

Cliff saw there were replies pro and con to you post. With one exception I have been extremely happy with my 59+ which I have had on line for two years now. It is on a patch panel and is jumped from one system to another but almost always in use. I hold regular skeds on 75 this summer and without the unit I frequently cannot copy through the noise levels and QRM. Have a Racal, couple of R-390As, three Kenwood xcvrs, and my "super" R-4C loaded with Sherwood mods and filters. It initially appeared to be the one unit that couldn't show a significant improvement with the filter but after a lot of learning...and tweaking of both...have been convinced there just isn't anything in the $2000-3000 range that won't benefit from the thing.

Now my one complaint. Well over a year ago the company offered, in magazine ads, upgrade chips for $10 dollars. I called them frequently, a friend sent email regularly (we both had sent in our money) and got every excuse in the world for failure to deliver. He finally after months of waiting got his and was disappointed in it because the 'new' manual that was to show how to use all the improvements that he had been promised never arrived. He finally sold the unit.

I never got the chip, the manual, or replies to my last two letters. I give up. I have heard there is a version three chip out now for it. Have lost the money order receipt so can't even trace whether they cashed it or not.

Me thinks they have a serious shortage of people and/or a communications breakdown.

In one last word of praise, a friend brought over his new MFJ DSP top of the line and doing A/B comparisons we only found a couple of areas where it had features more desireable than the Timewave and many areas where it didn't perform nearly as well.

BTW almost all my 'on air' activity is via Pactor or Clover now and with the highly congested areas for digital on 20 I don't think I would bother without the T. Wave or some DSP unit. Prior to buying it I relied upon two Datong FL-1s back to back. While they occasionally got confused they did a creditable job if I could twist knobs fast enough. Once a QSO was established it was no big deal but it was madness to try and tune for a random signal with them on.

Bottom line.....I love the filter, would consider another from Timewave if they could get their act together on upgrades, and would urge you to keep trying after you assertain it is not defective or too aggresive.

Are there any good freeware/shareware split screen terminal programs
for the Apple Macintosh? I am primarily interested in RTTY on a AEA PK-232.

AEA sells a program called MacRatt 3. Is this any good? It costs $100, AND
I have to upgrade the ROMS in my PK-232 (another $100). I want to be real
sure, before I go this route.

If you have a simple terminal program (like in Microsoft Works or Claris Works) you can type in the commands listed in the owners manual from the keyboard. That works, when I run point-to-point GTOR connections I frequently use a terminal comms program like that.

Try Hostmaster/Mac by Kantronics written specifically for Mac users and Kantronics equipment. It's a pretty decent program. Lets you maintain multiple connections in separate windows.

For TCP/IP capability get Net_Mac v.2.3.60 available via ftp from ftp.ucsd.edu I think in the /pub/hamradio/incoming directory. It is a monolithic application like JNOS.

Someday soon there may be a freeware MacAX25 driver released eventually; Tim Hayes N2KBG has been doing some work on it in his spare time (spare time? what's that?) he has a webpage about it. Use Lycos or Webcrawler or Yahoo search engine and look for MacAX25. Progress has apparently been slow, I think the change from MacTCP to Open Transport didn't help, I think it was originally planned for release to beta test to the ham community last December. When it finally does hit the streets then you will supposedly be able to use the intrinsic TCP/IP capabilities of your Mac, although I don't know how much built-in TCP/IP a Classic II has.

======== comments GM0CSZ / KN6WH

Could someone please educate me ? 1200Baud packet utilises AFSK
which usually modulates a FM and/or PM transmitter. The audio tones
are as per Bell 202 tone pair (I believe) being 1200 and 2200 herz .
If the TNC get these tones ,it will work.
Why should pre-emphasis be necessary ; is it necessary that the TNC
is receiving these tones with equal-, or for argument's sake
non-equal amplitude ? In an FM tx the deviation is proportional to
the amplitude of the modulating signal, so ,it is my understanding
that if the deviation of the 2200 herz tone ,due to pre-emphasis,is
about twice that of the 1200 herz tone, the ratio in amplitude is
accordingly, or am I missing something?

I have the Peet 500 Roger and it works just fine. One word of advice
though, if you order one, make sure you get the updated version with
Barometric pressure on board. I think it's the 2000. You'll find the
people at Peet really helpful, and if you phone the order through,
you'll have it in your tiny hands within the week! You might also
enquire about the extra lead for attaching the whole shebang to the
PK232, to which direct connections can be made for transmitting
bursts of packet wx info... I don't have the faintest idea how to use
this option but I'm sure that if you buy a Peet Weather Station, we
might reasonably expect to see the Winpack 5 point something or other
encompassing that modification when you upgrade later versions of your
popular software - [please] - Ken/G4MPQ

For Sale,

a Tempo MPP1 mobile packet TNC with built-in printer. TNC has 32K RAM with Lithium battery backup and runs off of 12VDC for true mobile operation. Has mounting bracket to mount in a vehicle. Printer uses adding machine paper and runs real slick. Includes computer, power, and radio cables (radio plug configured for 4 pin Yaesu microphone). Like new condition, $75.00.

Thanks, 73 de Jeff, WK3U.

As a simple terminal (split screen) program, try:

ftp://ftp.funet.fi/pub/ham/mac/demon/Virtuoso_v1.4.sea.hqx

For more advanced (TCP/IP and NETROM) use, try:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/mac/NET_Mac2.3.60.sea.hqx

NET/Mac takes a lot of work to fine tune it to your local "ampr.org" net,
which is likely to DOS dominated, but it's a lot of fun afterwards..

Sounds like a nifty piece of legislation we have up here now called
EMCAB-2. Part of the reality of it is the necessary tests involve taking
measurments every metre in a cubed grid about the station! Wonder how
much that one is going to cost. It's been stressed at a few meetings that
it's not likely to get to that stage and might only be applied in the
event of an otherwise unresolvable EMI problem, not exactly with you have
to put up with. 73 John VE6OTC

> complains about "ESS not loaded for COM2".

Insert in the OS2 config.sys file, the statements

DEVICE=D:\SIO\SIO.SYS
DEVICE=D:\SIO\VSIO.SYS
DEVICE=D:\SIO\VX00.SYS

where you will need to change D:\SIO in the statements above to reflect
where you have placed these files.

If you are using non standard IRQs or port addresses you specify those,
too.

All this is covered in the docs that come with the SIO file.

The install program for SIO will do this for you when you run it.

If you install the drivers by manually editing the config.sys file, then
you also need to rem out the existing COM.SYS and VCOM.SYS drivers.

I use JNOS obtainable from pc.usl.edu (ftp site). It works just fine...
has run for weeks with no lock ups.

Don't waste your time or money on Part 97 ham gear.
Unless you like dealing with frustration(JNOS), ignorance(PBBS networks,
plug/play mentality), and slow speeds(1200 bps!);
go with Part 15 devices on 900Mhz(and up) that function as wireless
LAN cards. You won't be limited to what you can transmit(business,
vulgarity, etc), speed is 1Mbps and higher, and you can run working
commercial TCP/IP software.

>still have rights too. They are worth $billions , and are under used.

Hams are stuck in the stone age and are poorly utilizing their
frequencies. The point of ham radio should be to advance the state of
the radio art, not to get a cheap phone patch. Let's face it,
for the common good of mankind, most ham freqs should be sold to
the highest bidder. CW, closed repeaters, and 1200bps packet are a joke!

>I think the future of packet must be in this direction , and would like to
>hear from users who can give me info on this direction.
>
>-Les

The last holdout application for 1200bps packet is APRS - unless
you are interested in this, forget ham packet and think about buying
a wireless LAN setup.

All,

I have the following for sale. All is complete and working.

1) Kantronics DataEngine
2) Tekk KS-900 UHF data radio on 441.000
3) Tekk KS-960 UHF data radio on 441.000
4) Alinco 1200T 1200 baud data radio (synth'd)
5) Pacomm TNC-2 (can't remember model number w/DCD)

All cables, power supplies, etc. Tuned, tweeked (for deviation) and ready
to go!

Looking to sell as a complete set and I would like to get around 700.00 for
the set. Please email any offers to ne1h@ne1h.radio.org

Thanks,
Alan Adamson

It's really a poor implementation of TCP/IP. You ever try to figure out the routing?? Type "route print" at the DOS prompt with an ethernet and dialup going. One look there, and you can see it's crap.

If you want to bang your head against the wall, the proper path would be a serial or DMA card interface code, connected to a Virtual Device Driver to make the network calls.

My sugestion is to make the machine useful, and install Red Hat Linux, or Caldera Linux on it. With that, you get real TCP/IP. Then upgrade the kernel to get the AX25 crap. Personally I'd probably just run a Part 15 device and not bother with the Part 97 crap. That crap was ancient back in 1990...

Just hook up a spread spectrum modem and a beam antenna, and run PPP between computers. Much more enjoyable, and you can even have a real conversation without the ARRL bringing suit :-)

Well, it is that time again! It is Hamfest Season, and it is time
for the annual Duke City Hamfest! Here is all the information:

WHEN: Saturday, August 17th - Sunday, August 18th
TIMES: 8:00 AM-5:00 PM (Saturday), 8:00 AM-2:00 PM (Sunday)
WHERE: National Guard Armory, 601 Wyoming NE, Albuquerque, NM

* * FEATURES * *

* VE Testing (Saturday at 1:00 PM) * Outdoor Tailgate Swapfest
* Hourly Door Prizes * Grand Prize Drawings
* Search & Rescue Forum * Contests
* On-Site T-Hunt * ARRL Forum
* MARS Forum * AMSAT Forum
* RV Parking (Sorry, no hook-ups)

* PACKET FORUM - Information, plus the start of NM's Packet Users
Group!!! Please sign up!

TALK-IN FREQUENCY: 147.15 (+ No PL) Repeater

* * PRIZES * *

Grand Prize: Yaesu FT-840 HF Transceiver
Second Prize: Alinco DR-150 2 meter mobile
Third Prize: Alinco 2 meter HT

* * PRICES * *

Tables without Power: $10.00 each
Tables WITH Power: $15.00 each
RV Parking: $10.00 per Night
Raffle Tickets: $2 each, 3 for $5

See everybody there!! Please E-Mail me if you need any information
before the Hamfest.

Best of 73,
Brian, N5ZGT

4305. Novice tcp/ip outlook

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-13 00:00:00 UTC
From: les@rfx.rfx.com
Message-ID: <les-1308961445570001@lesmac.rfx.com>
Source record: 35496

I am looking into expanding my internet activities into my other hobby, ham radio. In particular , seting up a high speed tcp/ip connection with another ham , or maybe a server. With the reading I have done so far on the subject , I am learning that the design evolution of the radio tcp/ip seems to have evolved in a different way than 'straight computer' connections.

On my Mac , the modem or isdn connection is done with a PPP driver. This serves as the link to the modem and it's serial line. The PPP driver does nothing else, besides setting the phone number and a few setup values. Then , *any* ftp client , e-mail program , ftp server , web-browser can use the link.

It seems that on the packet radio side , the e-mail/ftp stuff is tightly integrated into the , for lack of better words, "driver" that is talking to the radio/modem.

Is this the case ? Or was I mis-reading the facts ? I hope so.

I just want to use the highly developed , standard TCP software out there and let the "driver" do only the low level PPP type functions to keep the tcp/ip link happy. I couldn't care less about BBS features. Thats what I use the internet for !. If I want to QSO with someone , I should be able to use the same telnet software I use now , not some non-standard one.
Some people may say " use a cell phone on a laptop if that's all you want to do " , but I can't afford that. Might as well use the ham bands that I still have rights too. They are worth $billions , and are under used.

I think the future of packet must be in this direction , and would like to hear from users who can give me info on this direction.

-Les

Has anyone had any luck at all getting any NOS to work with encapsulation with a PPP-PAP link? I have one compilation of KA9Q that will recognize the merit PPP dialup, but even after attaching asy as well as I know how :) I get improper communication, when I asystat, I can see that something may be happening, but it sure isn't what I want to happen :). I even tried just for kicks making the localhost the default gateway, but no go. I just must be estupido, I guess. If anyone has any enlightenment, or any luck with ANY PPP dialup stack, let me know. TNX for reading this, 73 to all!

Contact R. Lewis, Box 522, Garrisonville, VA 22463. He sells a PC program
for the Tono 777. $25. If you are unsuccessful in contacting him wite me
and I will provide further help.

The 777 is considered to be one of the finer TU's with good filters. It is
hard to use without the program, however because every action requires
complex keyboard commands. It supports cw, amtor, and rtty but not the
newer modes.

If anyone else sees this and is looking to buy a 777 with the program
please contact me as I have one.

73, ron w8gus.

4314. A-Tronix C.W. keyboard

Newsgroup: rec.radio.amateur.digital.misc

Hi, all.

I recently acquired an A-Tronix C.W. keyboard that is missing a number of key caps, as well as an operating manual. I would be grateful to receive any information about either item's availability. Being blind, I would prefer an ascii copy of the manual if possible, but would be willing to pay for a xerox copy of a print one, if it's the best I can do.

73,
Dave WD8LDY

That all sounds good , but what kind if range can I expect ? I am looking
for something truely mobile , not just between 2 close offices.

Can this type of equipment cover reasonable distances , without setting up
15 element beams on my back bumper ?
Where can I find the vendors of the hardware ? Web pages ?

Also , Can the cost be < $1000 per station ? Is the software cheap ?

Thanks for the response....

YEAH!!!!! That's the ticket. Not only can they NOT restrict you
from having a tower, you MUST have at least, say, a 100 foot tower.

If you can't afford one, the government must assist you in getting
one... today FOOD STAMPS, tomorrow TOWER STAMPS!! :-)

Hello and thanks for reading this..

I am too lazy right now to look this up myself, so I thought I would post it here and have someone that knows more about these things than I do to respond.

Is it legal to operate 9600 baud paket on 2 meters.. I may be mistaken but thought that it was illegal due to the excessive bandwith required for 9600 baud.. Please correct me if I am wrong..

Thanks
Don Murray

Anyone out there know what might be the cause of my Kam operating
in the following way:
Kam talks with the computer ok. I can send and receive on Pactor,
Amtor, etc. without problem. I can only receive VHF Packet. I can initate
a connect request and watch my KAM respond, and the Yaesu FT-2400
transmit, but I am not able to connect with anyone. Have tried different
software programs, to no avail. Problem has to be with KAM somewhere.
Any ideas are greatly appreciated.

Try using Zterm it's just a terminal program but you should be able to use it to get started using the TNC. I would get Hostmaster Mac from Kantronics it's a good packet software program to use with the Kantronics TNC's.

Joe,
The first thing I think of is maybe you have tnc parameter not set correctly... One way to quickly resolve this is set the tnc back to factory defaults by shorting jumper "k6" this procedure is detailed on page 63 of the KAM manual.
You may have done this all ready but it sounds like you have things working from a hardware standpoint. There are several commands that could be causing your problem if they are set wrong. The reset will put everything back to a basic factory configuration.
Here are some of the individual commands that might be causing you trouble....

CONOk ON
CONList OFF
TXdelay 30/30

These are just a couple of possible problems.... Good luck

i would suggest there are 2 ways -- one is to do the big bucks approach to
put "ethernet on the ether". the other is to find a way to move messages
effectively using existing equipment (improving the utility of the existing gear).

the 2nd case was the model for the amateur radio systems. not saying there
aren't problems with this model, but it is just as valid a method for development
as using the big bucks method.

>

Stewart:

What's your beef with ham packet applications? Granted, 1200 - 9600
packet is pretty slow, but the equipment is affordable and ubiquitous.
Not everyone has the bucks to go setting up a 900 Mhz spread spectrum
wireless network.

Re: advancing the radio art: I know some hams here in Boston that are
working on setting up 10 Mbps microwave wireless network that is
flexible,
portable, and easily aligned, I would say that is advancing the radio
art.

Re: selling off ham frequencies: When you at the radio sprectrum, there
is really only a very small part of the it that is allocated to
amateur use.

From the responses you got, I am a bit disappointed. I think for many of us who have working Windows 95 machines, it ould be REALLY nice if there were some native Windows 95 TCP/IP/AX.25 driver. I think what the original poster was looking for was a way to use existing Windows 95 programs (such as e-mail, Netscape/MSIE, FTP, ping, etc.) except throug a TNC. We have dial-up services, LAN card services, why not a serial port TNV service?

Microsoft could spread a LOT of good will if they would write a simple, solid ax.25/TXP/IP driver.

(I know that TCP/IP really needs higher speeds than 1200 baud to be effective, but it would be a start!)

I own this product and I an considering changing to something that will correctly print labels! Version 3 has all of the capablities you are asking for but the label printing function is broke for HP printers and AEA does not seem to want to fix it.

Jim

You might give ethrax25.zip a try. Available from pc.usl.edu under packet drivers, it worked flawlessly (albeit slow as heck even at 9600b!) under windows 3.11. Now, trumpet allowed for the packet vector to be set, and ethrax25 was a dos tsr. You set the vector you wanted it to use and then told trumpet to use it instead of the regular winsock. Im wondering if you loaded it and configured the winsock under 95 to bind to it instead of the regular Windows 95 winsock?

Anyway, it worked fine, and did just what Mike was looking for under 3.11, so maybe there is another 3rd party solution, other then holding your breath and waiting for Micro$oft to release something.

Charlie

4335. Spread Spectrum for the birds?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-15 00:00:00 UTC
From: teazes@gat.com
Message-ID: <4uvncr$2n6@rosebud.sdsc.edu>
Source record: 35231

I got to thinking(dangerous), and it occurred to me that the real benefit
of going digital is wide bandwidth. The fact that spread spectrum
is inherently wide bandwidth seems to be an afterthought to these
theoretical high-compression heads making a mint in the communications
industry.

It is apparent to me that a simpler TDMA scheme spewed through a
simple wide-band transceiver would be much less costly to implement,
while providing all the same channel reallocation benefits.
Better yet, it doesn't take a Phd. to understand it.
These snake-oil salesmen have sold people on the idea that somehow
we can get more signal thruput by using spread-spectrum - BULLSHIT!
It is NOT a perpetual motion machine.
The real benefit lies in that it is inherently encrypted, and
that these high-compression heads can line their pockets with
the U.S. government's research dollars. What a SCAM!

9600 baud is permitted on 6 meters and up. The deviation is normally se
for ~3 kHz, which doesn't result in excessive bandwidth.

Larry,

Take a look at http://www.webcom.com/sedan/ ; that may have what you
want.

If not, a note to Buck Rogers K4ABT should get you what you need.
His Internet address is: buck4abt@usa.pipeline.com

He was providing a 3.5" disk with the latest Nodeware on it if you sent
him an SASE of decent size and postage applied. He may still be.

Hello folks...

I wonder if there is an utility for FBB software that works like C_FILTER
and that can be configured to ban user access more times and more minutes
than sysop decided. Something like time-out at telephone-style bbs's where
you may login 1-2 times a day 45-90 minutes each. I know FBB has a counter
of minutes (command: !) and it may be used for this purpose. It also may
be reset to zero at the house-keeping process, like FBBDOS download counter.

If somebody has an idea where to find such utility, let me know...

>_didn't_ cause it.

Well, I just lost my mother 2 months ago to breast cancer. She was not a ham, and you could not get her to even pick up a mic. It came on suddenly and ended suddenly. Started with a small lump in Jan 95, ended in death June 96. Cancer isn't funny, nor is blaming something for causing it without proof.

I saw what my mother went through, and wouldn't wish that on anyone. I hope you have much better luck, which I'm sure you will.

Perhaps the use of an HT helped keep the cancer cells at lower level than they would have been without it?

Just a thought.

Take care..

Nice try guys, but I might wait a while before starting construction of that
favorite "look alike" antenna. This one is DEFINITELY going to end up in
court as has been discussed on several broadcasting list severs because the
FCC is trying to preempt deed restrictions and every homeowners association
is against this. Just waiting for the fireworks to begin.

>thought that it was illegal due to the excessive bandwith required for 9600
>baud.. Please correct me if I am wrong..

NO! It is NOT illegal to operate 9600 baud packet on 2 Meters.
There have been studies done that indicate a 9600 baud FSK signal
may actually take up LESS bandwidth than a 1200baud AFSK signal.

The problem is that the window of opportunity for 9600 baud packet
is gone. It is now too slow to compete with dial-up services.
100Khz 56Kbps operations show some hope on 219Mhz. However,
a lot of the more leading-edge, digital-knowledgeable hams
burned-out trying to get people to move to 9600bps,
so don't hold your breath. And the real benefits of "going digital"
occur at much higher data rates than 56Kbps.

The fact is, the Amateur Service has stagnated into a defensive
"keep what we've got" stance. There is no decent spectrum space
left to go to new digital techniques that require larger bandwidth
in order to realize their potential.

By moving to digital techniques(something akin to ATM) -
we could make better use of our frequency allocations, as voice, data,
and video could be channeled through one giant TDMA pipeline repeater
with wide area coverage - something like what the cellular telephone
guys do. Such a system would be much easier to reconfigure than
the small bandwidth analog scenario we now have.

But, alas, the real experimentation is going on in the commercial world,
where folks are making big bucks eeking out more spectrum efficiency
on cellular and satellite communications.
Sadly, the word "experimentation" seems to be missing in most
modern-day ham's vocabularies.

Hello,

I've just bought a 70cm Handheld transceiver to use with my PR kit.
It is sold as a Albrecht 402, but the packaging says it is a Hora C-455 and
some of the documentation refers to it as a Standard C450.

It comes
with nice instructions how to convert it to 9600 Baud, but no hints on how
to use it with 1200 Baud. It has a 3.5mm mono jack presumably for the speaker
connection and a 2.5mm stereo jack for the mic and ptt.
Does anybody know how the mic an ptt are connected up on this for a TNC or
a mic.

Please mail me your reply as well as posting it, because my news server
is somewhat erratic at the moment.

More like a fantasy. I am *very* sorry to read of your loss; statistics show 1 in 4 women will suffer from that form of cancer. But let's please keep emotion out of this ruling. Self-denial that RF cannot cause illness will only hurt yourself, but coming on here and stating that to hundreds of thousands of folks is irresponsible.

Keep your HT at its lowest power setting (not only for health reasons but also to comply with Part 97). Use a speaker mic and hold the HT at arm's length when transmitting (who cares what that will look like - you'll be setting a good example).

Be safe,
Jeff KH2PZ

There is also a NDIS3PKT vxd driver, it does the same as WinPKT for
win3.11 but links you to the Win95 IP stack.
It is written by Dan Lanciani. You can find it at:
ftp://ndtl.harvard.edu/ndis3pkt/
As an alternativ to ethrax25 you can use pc-flexnet with the IP
extentions.
Look for FlexNet at: http://www.th-darmstadt.de/diverses/afthd/flexnet/

>N8GYA
>jstair@icgroup.net

Hi Joe.

Make sure you CONOK parameter is "ON", and set you TXDELAY to "40".

If that doesnt work, I would check to see if the radio is transmitting. If it is, I would then listen with another radio on the same freq. When your radio TXs, it should be the same "volume" as the other stations. If your tone audio is either weak, or stronger, look at adjusting the deviation as prescribed in the manual.

If the audio is non-exsistent, I would take a look at the TNCs "signal out" wiring circut to the radio.

Thats all I can think of of the cuff, let us know how you do.

Take care.

I've played with some 'TV3' RF modulators and it seemed to work
OK. Used a data slicer on the video output. Of course, AM
does have its problems but it was quick and dirty.

I'd look at some of the FM TV equipment that is out. There are
a number of people that sell this, a little more but would
be a much better match for digital transmissions.

You don't happen to be in the Detroit area, do you? My biggest
problem with these sort of experiments has been finding folks
that have both the interest, time and experince to do these
sort of things (experiment).

4359. Motorola DSP56002 Evaluation Modules

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-16 00:00:00 UTC
From: rwhiting@winternet.COM
Message-ID: <199608162054.PAA09308@icicle.winternet.com>
Source record: 35157

TAPR and Motorola have agreed on a special group purchase of the Motorola DSP56002 Evaluation Modules (EVM) for a limited time. The DSP56002 EVM is a general purpose DSP board with on board peripherals and software for assembling and debugging code. TAPR would like to thank Tim Baggett, AA5DF, of Motorola for facilitating this purchase.

The price will be:
$85.00 US (+ s/h) **

The EVM56002 normally retails through distributors for $150.

** No 10% Discount for TAPR Members.
Due to the nature of the purchase, TAPR cannot offer a membership discount.

For more information on the DSP56002EVM purchase, please see the TAPR web page at http://www.tapr.org

For more information on the DSP56002 EVM and Motorola DSP products visit the Motorola DSP web page at http://www.motorola-dsp.com.

Please note: This unit provides a minimum interface for radio connections. Additional circuits are required for specific radio interfaces based on the application. See the TAPR HF SIG Upload Area (ftp.tapr.org /tapr/SIG/hfsig/upload) for files on one type of radio interface. There are other units that provide complete radio interfaces and should be considered if you feel that you are not capable of building such items.

This EVM group purchase will include:

* EVM56002 Board
See below for specs.

* Motorola's DSP56000 cross assembler
* Domain Technologies' debug GUI debug software (DOS, >386 CPU)
both communicates with the EVM over an RS232 serial port

* Available amateur software developed for the 56002 EVM board

* Documentation
56000 Family Manual,
56002 User's Manual,
56002 Data Sheet,
Quickstart Guide,
Debugger manual, and
Schematics

TAPR will be taking orders for up to 200 units.

Orders will be taken through the ARRL/TAPR Digital Communications Conference in Seattle on September 21-22, 1996.

Shipping will not begin until the units are delivered from Motorola, which will be sometime after September 22nd. Money will be deposited when the order is placed with Motorola.

If you would like to order one of these units, you can
e-mail tapr@tapr.org,
phone (817) 383-0000, or
fax (817) 566-2544.

Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time

Questions concerning the unit and details on the buy will be handled on the TAPR DSP-93 Special Interest Group list. To subscribe, send e-mail to listserv@tapr.org. In the message type subscribe dsp93 YourFirstName YourLastName. The server will then send you a message back. Announcements on the status of the shipment will be made to the TAPR DSP-93 list and TAPR-BB lists.

Shipping and Handling
---
* Shipping and Handling within the US will be $10.00 US by UPS Ground unless otherwise requested by purchaser.

* International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

General Information

The DSP56002EVM is based on the 56002 general purpose DSP by Motorola. The 56002 is a 24-bit precision, dual memory space harvard architecture digital signal processor. The board contains a stereo CD-quality audio codec, on-board 32k words external SRAM, and an expansion spot for a 32K flash EEPROM. The user only needs to supply the IBM PC compatible computer, a 7-9 volt AC or DC power supply, and an RS232 cable for interfacing to the PC.

The DSP56002 EVM is perfect for the hobbyist and student wishing to learn DSP programming on the Motorola 56002 DSP. Many amateur radio applications have been written and used on the DSP56002 EVM including, 1200 AFSK packet, 9600 FSK packet, RTTY, BPSK, QPSK, and various audio filters for CW, SSB, and QRM/QRN reduction.

The 24-bit DSP56002 feature:
40 MHz operation (new EVM's are 6 MHZ, and most have operated at much higher clock rates)
20 MIPS at 40 MHz (50 nS instruction cycle at 40 MHz)
120 Million Operations per second (MOPS) at 40 MHz
512x24 bit on-chip program RAM with bootstrap ROM
two 256x24 bit on-chip data RAMs (X and Y data spaces)
External memory expansion with 16 bit address and 24 bit data bus
Byte wide host interface

Synchronous Serial Interface (SSI)
Serial Communications Interface (SCI)
24-bit timer/event counter
software programmable internal clock PLL

The EVM features:
32kx24 bit zero wait-state external SRAM
option for 32Kx8 flash EEPROM for program bootstrapping and
stand-alone operation
Crystal Semiconductor's CS4215 stereo CD quality sigma-delta A/D D/A
on-board voltage regulator
RS232 interface to the OnCE (tm) controller
RS232 interface to the DSP SCI port for communication between the
DSP56002 and a terminal (PC) directly
connectors for external access to the DSP56002's memory expansion,
host interface, and serial interfaces (SSI, SCI)
documentation (56000 Family Manual, 56002 User's Manual, 56002 data
sheet, quickstart guide, debugger manual, schematics)

The on-board Crystal A/D D/A features:
24.576 MHz crystal for sampling at 48, 32, 16, 9.6, and 8 Ksps
16 bit linear, 8-bit mu-law, 8-bit a-law, and 8-bit linear sampling

the 24.576 MHz crystal can be replaced to provide other sample rates
Software programmable signal attenuation

P.S. TAPR is also doing a group purchase on PC-DSP and PC-SIM for Windows.
This is an excellent package for learning and developing DSP software.
See: http://www.tapr.org

The PC-DSP is an interactive, menu-driven software package used for:
waveform synthesis using a variety of methods, basic signal operation, fast
Fourier transforms, convolution and correlation, solution of difference
equations, analysis and design of IIR and FIR filters, digital filter
simulation and code generation, and power spectrum estimation using
classical and modern techniques. Some key features of PC-DSP listed
include: GNUPLOT support, code generation, macro compiler, dialog compiler,
sound file support, data file formats, and compatibility with PC-SIM.

>
> Can this type of equipment cover reasonable distances , without setting up
> 15 element beams on my back bumper ?

With two FreeWaves (115kbps, 900mhz) I can cover about 3 miles base to
mobile. It is solid for the first mile. This is in a suburb of detroit.
The base antenna is a vertical (I think 6dbi gain) at about 40 feet. The
mobile antenna is a mag mount cellular antenna, which is not at all
optimal. If you want to go at a slower speed, you could get longer
range and shorter if faster. FreeWave is at http://www.freewave.com

> Where can I find the vendors of the hardware ? Web pages ?

There is alot of good info at http://www.tapr.org Also, think about
joining TAPR. They are the only group that truly represents the needs
of the 'digital' amateur.

>
> Also , Can the cost be < $1000 per station ? Is the software cheap ?

That kinda varies. I've seen surplus for 100-200 each and off the shelf
for 600-2000. Software is, by and large, exactly what you use now. I've
even seen drivers for LINUX.

4363. Kantronics Data Engine Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-16 00:00:00 UTC
From: kb4lfh@vnet.ibm.com
Message-ID: <4v2bqn$1kg0@rtpnews.raleigh.ibm.com>
Source record: 35161

We've been running a Kantronics DataEngine for about two years now using the G8BPQ code as the node software. The DataEngine links a 1200bd 145Mhz LAN to a 9600bd 440Mhz LAN. A BBS resides on the 440 side. I have two questions on this setup.

First, The BBS (JNOS) is setup to beacon users that have personal mail waiting. How do I setup up the BPQ code and the JNOS station to get the beacon to the 2meter side. The BPQ mode is setup up to digipeat. How do I route the beacon through the BPQ node?

Second, Is there better firmware that runs on a DataEngine? We've looked at running JNOS4, but the heard list would constantly fill with garbage, and performance was terrible. I've heard there was a hardware "patch" but has anyone performed this and does it help?

ANY AND ALL HELP IS APPRECIATED.

Thanks,
Michael Crowder

Well, it is that time again! It is Hamfest Season, and it is time
for the annual Duke City Hamfest! Here is all the information:

WHEN: Saturday, August 17th - Sunday, August 18th
TIMES: 8:00 AM-5:00 PM (Saturday), 8:00 AM-2:00 PM (Sunday)
WHERE: National Guard Armory, 601 Wyoming NE, Albuquerque, NM
(Near Wyoming & Copper, on east side of Wyoming)

* * FEATURES * *

* VE Testing (Saturday at 1:00 PM) * Outdoor Tailgate Swapfest
* Hourly Door Prizes * Grand Prize Drawings
* Search & Rescue Forum * Contests
* On-Site T-Hunt * ARRL Forum
* MARS Forum * AMSAT Forum
* RV Parking (Sorry, no hook-ups) * QRP Forum
* ATV Demonstration

* PACKET FORUM - Information, plus the start of NM's Packet Users
Group!!! Please sign up!

TALK-IN FREQUENCY: 147.15 (+ No PL) Repeater

* * PRIZES * *

Grand Prize: Yaesu FT-840 HF Transceiver
Second Prize: Alinco DR-150 2 meter mobile
Third Prize: Alinco 2 meter HT

* * PRICES * *

Tables without Power: $10.00 each
Tables WITH Power: $15.00 each
RV Parking: $10.00 per Night
Raffle Tickets: $2 each, 3 for $5

See everybody there!! Please E-Mail me if you need any information
before the Hamfest. Or call Judy, KC5HZE (Hamfest Corrdinator) at
(505) 891-9132 .

I use Logwindows 3.0 with win95 and a Radio Shack printer. When I tried it with the RS driver it didn't work but when I set it up as an epson 24 pin which the RS printer emulates it worked just fine. I have heard some grumbeling on the LW reflector about print problems but have not had any myself.

You might try calling AEA and telling them what your setup is and having them confirm printer compatibility.

Les,

What you want to do is quite reasonable and, amazingly, not something that most hams seem to desire. What is needed (for Windows95 at least) is a VxD MAC (media access) driver for a KISS-mode TNC that binds to the TCP/IP stack on the top and uses VCOMM on the bottom (to get to the serial ports). An alternative would be a similar driver for something like the PI-2 card for high speed packet (56Kb and up). In either case the driver would look like an Ethernet card driver to the upper protocol levels.

I've wondered why nobody seems to have written such a thing, until I started looking into it in detail a couple of weeks ago. The Win95 DDK doesn't provide a lot of key information and the toolkits (such as Verio) that make writing drivers possible cost a lot ($495). Aside from that, building one is probably straightforward for someone that has any experience writing VxD network drivers. I guess none of them are hams.

Maybe if enough of us see the value (or fun) in enabling a 56Kb+ wireless amateur internet we could get something done.

73,
John, KK5MH

4370. Re: 9600 baud on 2 meters ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-16 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10832@wb9mjn.ampr.org>
Source record: 35168

Hi,

Yes, it is legal to operated 9600 baud on 2 meters.

The FCC baud rate limit on 2 meters is 19.2 KB. Altho, there are additional BW limitations as well.

9600 baud K9NG modulation, and the G3RUH modification of the original K9NG spec, both have Bandwidths that are narrower than Voice modulation. I, amoung others have done comparitive BW measurmenets with spectrum analyzers.

The common confusion as to the signal being wide is due to the IF filter requirements for narrow digital modulations. If one had a perfect IF filter, that caused no signal distortion, one could pass the K9NG modulation thru about a 10 Kc BW. But, there is the problem of frequency mismatch between radios, and more importantly Group Delay Distortion. The propagation time thru a IF fiter is dependant on the frequency. In the center of the filter, propagation time nearly the same, but as one gets towards the edges, the progagation time can be very much different, than the center. The usual voice grade IF filter will time delay part of the data signal, by more than a bit time, at 9600 baud. Thus there is a ditortion to the 9600 baud signal, which renders it undecodeable.

The cheap way to get around this, is just to wide the IF filter. Thus, the confusion that the 9600 baud signal itself is wide. There are digital filters available, too, but these are a compromise between adjacent channel rejection, and group delay. And, much narrower BW versions of the digital IF filters work well. Proving the signal itself is narrow in BW. But, an agressive chebyshev voice style IF filter, has the worst group delay problems, and a very much wider IF filter on this variety is needed.

In conclusion, 5 Khz deviation at 1 Khz modulation Voice modulation is much wider in BW than the K9NG and G3RUH versions of 9600 baud .5GFSK modulation. 19.2KB is the upper limit on 2 meters. Digital radios require special IF filters, or wider cheap IF filters to operate satisfactorily.

JNOS40 is indeed CRAP! I lost a lot of time and face when I
coordinated to put my DE w/JNOS40 up as a wide-area hilltop node
in Southern California. It lasted less than seven days.

> I've heard there was
>a hardware "patch" but has anyone performed this and does it help?

I would like to hear about it as well. (But to be honest,
1200bps and 9600bps is too slow to run TCP/IP).

You should be aware there was just a group buy off one of the TAPR
SIG groups (SS@tapr.org). A 2megabit SS transciever for $200. I'd
challange you to find a TNC/RADIO combo anywhere near this price.
Granted, this was a surplus sale, but you can get decent SS gear
for around $700.... considering the performence I'd not at all
consider this 'big bucks'. It can't do 'autopatches' but if your
interested in high speed digital, it fits the bill.

Source record: 35171

Hi,
Can you please tell me if there's any software to work all or almost all the digital modes supported by MFJ-1278B besides MULTICOM ?
Windows 95 platform will be most appreciated but DOS it will be also OK.
For Packet I would like to use one with traffic monitoring during a connection. Sometimes is usefull to see how packets are going while connected.

Please reply to this newsgroup or to ct1ete@grupo.bfe.pt
Thanks

4380. MFJ 1270C/9600B Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-17 00:00:00 UTC
From: cornwaab@ednet.ns.ca
Message-ID: <4v4dum$152m@Trademart-1.EDnet.NS.CA>
Source record: 35176

Hello,

Maybe you can advise me about a problem I am having with an
MFJ 1270C TNC with a 9600B modem installed (at the factory). The
problem shows up in 2 ways using 9.6K:

1. the DCD light flickers even when no carrier is being
receieved. This occurs when connected to either my Yaesu FT736
or MFJ 8621 data radio. In AX25 mode the consequence is that
the TNC is reluctant to transmit because it thinks that a
carrier is already on-frequency. After a while it will transmit
between 'flickers'. I can tell the TNC to ignore the 'flicker' by
setting fullduplex ON. I have experimented with various audio in
levels, but this does not seem to matter.

2. in KISS mode when receiving data from KO-23, the TNC
refuses to transmit. I cannot even do a manual directory request. When
I disconnect the receive data line the TNC will send out a backlog
of transmissions. Moving jumper JP8 (DCD select) makes no
difference.

I have an Pacccom TNC with 9.6K modem and it does
not exhibit these problems. By the way I am still using PB for KO-23
satellite communications.

Do you have any suggestions about how I might resolve this
problem?

Do you use the MFJ 1270C/9600B combination; how well does
it work for you?

Thanks for your help.

>
>I would be interested in your definitions for the "fast local net" and
>the "slower long distance nets"... What speeds come to mind when you
>think of this, Gary?

LOCAL NETS:

Right now, the best high speed local solution is 56 kb. We can go
faster, but we run into a number of problems with LAN configuration
when we do, IE we have to use surveyed point to point links or a
high central hub. Both of those are vulnerable to systemic failures,
and limit the ability of stations to join the network on an ad hoc
basis. Multipath and required bandwidth (with the consequent need
to move up in frequency) are the two problems of higher speeds
which force us into a rigid topology when we start wanting to go
faster than 56 kb. (SS technique can solve some of these problems,
but we aren't yet allowed the flexibility under SS rules to take
advantage of the potential.)

Except in special circumstances, I don't think it would be wise
to require a rigid topology for our local nets. Stations should
be able to drop in and out at will without adversely affecting
the network. And we should be able to configure networks on the
fly and not have to do a lot of RF path engineering just to get
going.

LONG DISTANCE NETS:

Right now, we're limited to 300 baud for long haul realtime links
(and that's a poor choice of baud for HF). That's a regulatory problem,
but one which may be intractable given the other demands on HF. We can
do considerably better from a technical point of view. The main problem
is multipath. Our symbol rate must be low enough not to be clobbered
by multipath, and for HF operation well below the MUF, that limits us
to about 50 baud. But we can use M-ary coding to overload several
bits on one baud, and we can use multiple carriers in *parallel*
to increase throughput, IE the Piccolo system, and to an extent the
system used by Clover.

If we were allowed to occupy a 3 kHz data channel, we could stack in
60 50 baud QFSM carriers, and that would give us an effective bit per
second rate of 12,000. That's feasible with a closed network of stations
where one static equalization will work for all. There's a hybrid scheme
where packet headers are sent slowly and the data portion sent at much
greater speed which would allow us to use dynamic link by link equalization.
(Every station could read the low speed headers, identifying the stations
involved without equalization, and then switch on the fly to the equalization
needed for that station pair, found during a one time training session at
the start of net activity, in order to copy the data portion of the packet.)
But I suspect that unless we used very long packets, the overhead would
negate the gain.

What I'd like to see is a regulatory change which would allow us
to use wider systems on HF, perhaps mixed in with voice and image
on those segments permitting 3 kHz bandwidths. Or better, allow
us to use SS over the entire band. We could easily do 9.6 kbps
with that and not bother (or be bothered by) other users. Right now,
the data segments are restricted to narrow bandwidths. In theory,
we could still push almost 2 kbps through the 500 Hz bandwidth
allowed (automatic forwarding subbands), but in practice it
would be very difficult. Clover can do 750 bps, and that's
about all we can expect under current regulations and with
currently affordable equipment (the DSP horsepower demands
skyrocket as we bundle more parallel carriers).

But Clover isn't packet, nor does it have the overhead
that packet has, and it won't directly interoperate with the
packet network. For batch forwarding in non-realtime, that
isn't an issue, but for realtime operation it is. If we
use a gateway with a circuit switched routing scheme, we
can run TCP/IP over Clover (just as we would over a point
to point landline dialup modem), but we would have to
mechanize the "call" setup and teardown procedures for
the gateway. And our throughput would decrease due to the
overhead of the TCP headers. It's doable, but no one has
done it yet for Clover.

>>>over 7+, YAPP, etc..
>
>>Not really. Bits are bits, and it is the physical pipe that determines
>>how much you can cram through it.
>
>7+ adds a large overhead. YAPP is not insignificant.

ftp's TCP header overhead isn't insignificant either, and it has to be
tucked inside *every* AX25 frame too. We don't have to do it that way.
The FBB BBS uses a compression scheme for batch forwarding which is much
more efficient than plain ftp or 7+ or YAPP. Note packet inherently
handles octet data, there's no real reason to use 7+ or YAPP to reshuffle
binary data into 7 bit ASCII printable characters. That's only useful if

the transmission system can only handle 7 bit data, and that doesn't apply to packet.

We could use the Xmodem protocol over plain AX25 if we wished, and pick up a 12.5% throughput improvement over 7+. Or we could forward using G protocol with compression and pick up a 50% or better improvement in throughput. ftp doesn't inherently do any of these things for us, though we can use compression with it too if we like. It does impose the TCP header overhead in each packet, which plain AX25 does not. Since we've already got the packet CRC to insure end to end integrity, we really don't have to burden each packet with other overhead to insure data delivery. We could just use a stream protocol with a header only added on a file by file basis if we wished, and that would be even better than using Xmodem or G protocol with their redundant packetizing of the data stream. (This is the virtual circuit model, of course.)

Apparently you haven't done the link budget calculations implied by going to higher speeds on satellite links. To do T1 rates, the link budget becomes extremely large by amateur standards, and most of it is *at the satellite*. In other words, you need a much higher powered satellite with much higher gain antennas to pull it off. The satellite, and the throw weight to get it to orbit, are the *most* expensive part of satellite systems. Amateurs *still* haven't raised all the money necessary to get P3D into orbit (our largest and most complex satellite to date). A satellite capable of T1 rates would be one or more *orders of magnitude* more expensive. And to make the necessary high gain antennas practically usable, a T1 sat would have to be at GEO, and that costs *lots* more to achieve than a GTO orbit.

Down low, a LEO for T1 rates would still be pretty big (due to the solar panel area needed), with the consequent aerodrag that implies, and thus would have a short lifetime. The doppler problem would also be almost intractable *at the satellite* because the doppler to every point in the footprint is *different* (and changing every second), and because to find the bandwidth for T1 you have to go to microwave where the magnitude of the doppler is much larger. With multiple stations uplinking, the satellite receiver would have to do dynamic doppler correction on a packet by packet basis. That's hard when you can't know a priori which way to correct for the next packet, IE you

may miss it entirely because you were slewed too far the other way for the previous packet from a station at the other edge of the footprint.

(Note, if you don't do at least bit regeneration at the satellite, the link budget requirement increases dramatically. A simple linear transponder would require more power than you could supply with reasonable sized solar panels on a LEO, where you have to keep aerodrag down to extend satellite lifetime.)

AMSAT has decided (correctly) that there are many more opportunities to hitch hike a ride (free or at dramatically reduced cost) into space if the satellite is small and light. And each satellite costs much less to build as well. A Microsat (2 kg, 10 watts total power budget) costs about $10,000 while P3D (450 kg, 500 watts total power budget) will cost about $2,000,000. Therefore, most of AMSAT's efforts up until the P3D push have concentrated on Microsats. There's no way in hell that a Microsat can do T1. Doing P3D has pushed AMSAT to the limit, and drained most of the long time workers. We're going to be lucky in the post-P3D period to find the resources and talent to just get some more 9600 baud Microsats in orbit.

(Note, P3D has two experimental 56 kb channels. They may or may not work due to the thin link budget. There's a fallback to four 9.6kb channels in that case. 1200 baud PSK will probably work through the analog transponders, using fairly ordinary Oscar class stations, but since they're continuous carrier, such use of the analog transponder will likely be considered poor practice.)

Gary

That's the ticket, Frank. The TNC modem wants equal amplitude
tones. Since everybody and his brother uses the microphone
input of his rig, the received tones will have a 6 db per octave
pre-emphasis added. The receiver then has to take that back
out. (Use of pre-emphais and de-emphasis is standard for voice
work, it attenuates high frequency channel noise and makes the
voices more pleasant to copy.) If you connect direct to the
discriminator, the audio tones won't be de-emphasized, and you'll
have "tone twist" at the modem. Most modems will be unhappy about
that, and you'll have a high bit error rate.

And if you use a direct connection to the varactor in the
transmitter, your signal won't have the proper pre-emphasis,
but other stations taking their audio from their rig's
speaker output will de-emphasize it anyway, and again you
have tone twist, but in the opposite direction.

If *everyone* on the local net uses direct varactor and
discriminator connections. The net will use *flat* tones,
and everyone's modem will be happy. If *everyone* on the
local net uses mic/spkr connections, the net tones will
be pre-emphasized, but every radio will de-emphasize them,
so the modems again see flat tones, and will be happy.

The problem occurs when you try to mix the two on the
local net. If some stations are using emphasis and some
aren't, no one can set up his station's emphasis correctly
to work properly with all the other stations. Thus aggregate
net throughput suffers due to excessive retries between
mismatched stations.

Hi,
I use Pc Packratt lite as the terminal program for my TNC. Supposedly it has two logging programms built in but I cannot access either of them. Anyone had the same experience? Ideas?
Thanx in advance,
A.J. N1VBH

You have to understand a bit of background to see how this evolved.
The original amateur TCP/IP implementation was done on a Xerox 820
running CP/M. CP/M was just a program loader, and once loaded, a
program took total control of the machine. Each program had to do
everything, from handling the physical layer interface on up to the
presentation layer. Thus, the TCP/IP implementation, then called
NET, had to "do it all" internally.

NET has been ported to DOS now, but that's still just a program loader,
not a real operating system. Therefore, lacking true multitasking,
applications like telnet and ftp, and low level drivers like AX25 and
the physical layer, still had to be included *internal* to the TCP/IP
program. The current versions (now called somewhat grandly NOS, for
Network Operating System), use an internal lightweight multitasker
(basically an infinite main loop and round robin scheduler) to allow
multiple ftp or telnet sessions. But as you would expect, this doesn't
allow separate applications to take advantage of the TCP/IP functionality
available. Only those applications *compiled into* NOS can be multitasked
and scheduled. Also, the AX25 driver and physical layer handlers are
still built into the program, again because DOS isn't a re-entrant OS.
DOS does have TSR capability, and low level drivers could be off-loaded
to that (and there is the Clarkson driver set which does that), but
that's a horrible kludge. The drivers need to be in the OS kernel.

As a teaching tool, NET (now NOS) was a way of introducing TCP/IP
to the amateur community using the primitive machines and program

loaders of the day, but it is hamstrung by the lack of a true
operating system. Enter Linux. Here is a real operating system, with
a TCP/IP stack, and a proper way to deal with drivers, sockets, pipes,
and daemons. Current kernels have support for a number of physical
layer devices such as the Gracilis card, the Ottawa PI card, Baycom,
or just a serial port to a KISS TNC. And there is an AX25 protocol
layer which can be accessed by the TCP/IP stack, and which can call
the physical layer device drivers in the kernel. Since Linux is a
true OS, applications like ftp, telnet, or any other sockets aware
program, can use the TCP/IP stack over ethernet, over dialup via
ppp, or over radio via the AX25 protocol stack and the kernel device
drivers. That's all transparent to the application.

>I just want to use the highly developed , standard TCP software out there
>and let the "driver" do only the low level PPP type functions to keep the
>tcp/ip link happy. I couldn't care less about BBS features. Thats what I
>use the internet for !. If I want to QSO with someone , I should be able to
>use the same telnet software I use now , not some non-standard one.

Since Linux doesn't run on Macs, and the NetMac software is just a port
of NOS which doesn't break out the various layers in an OS aware manner,
you have to do what you want another way. That way is to slap together
a simple DOS box, load it with NOS, an ethernet card, and a packet physical
layer card like the Ottawa PI2 card. Set it in a corner, hooked by ethernet
to your Mac, and hooked to the radio. It can then serve as a router bridge
to connect applications running on the Mac using Mac TCP/IP to the amateur
radio TCP/IP world.

This is a kludge, but it is a cheap and functional kludge which many
of us used before Linux was available. Any machine running a TCP/IP
aware OS, but lacking a built in AX25 protocol stack and physical layer
drivers for packet hardware, can be hooked to the ethernet (which all
TCP/IP implementations support), and the DOS box in the corner handles
the radios. (In fact, that's all a Telebit Trailblazer is, just a DOS
box running a modified version of NOS, serving as a router and modem
pool server for a TCP/IP ethernet LAN.)

>start making the measurements.

The official limit is based on NCRP 86 and ANSI C95.1-1992.
You are correct that people with indoor antennas are probably
in somewhat of a bind. However, don't forget that the standard
requires a 6 minute *average* for controlled exposures and a 30
minute *average* for uncontrolled exposures. Given the duty cycle
of typical amateur operations, this is an escape clause for many
amateurs. Old timer AM operators who talk 10 minutes at a stretch
with their plate modulated kilowatts are in trouble, but the average
SSB operator probably doesn't have a high enough duty cycle to break
the limit *on average*, first due to the peak to average power
ratio of SSB, and second due to the quicker back and forth nature
of the conversations typically held on SSB.

I've compared the calculated exposures I posted earlier with the
FCC measurements made at a number of amateur stations. My calculations
seem to give distance numbers that are about 30% pesimistic compared to
the FCC's actual measurements. (Of course my assumptions for those
calculations were intended to be conservative.) But that's encouraging.
The FCC only found stations breaking the limits when they used ground

mounted verticals, open wire fed flattops, and a quarterwave whip
on a car.

I think Sumner's contention is for the most part correct. High
power AMers and RTTY operators may have something to fear, but
most of us are going to squeak through. I'm more concerned about
what this is going to mean for access to good repeater sites.
We're dealing with combined exposures here, and the fields
could be very high, and with a high duty cycle. This may
affect maintenance access to sites in such a way that amateurs
may be denied access simply because it would be too inconvienent
to the paying customers if they had to shut down while work
was done at the site. "Moonsuits" may be an answer, but I don't
relish having to wear one of those on the tower.

>
>Rob Neff (N7ORY)

There is a chart. It is on page 96 of the report and order. It shows the controlled exposure power density in the 10m band to be 900/f, or about 30 mW/cm^2, and the uncontrolled exposure to be 180/f, or about 6 mW/cm^2.

Now to get down to that level, the RF field from a 100 watt isotropic source would have to expand to a sphere of surface area 100 watts/.03 watts/cm^2, or 3333.33 square centimeters. The formula for the surface area of a sphere is A=4*pi*R^2. We know A and want R, so we rearrange the formula to R=sqrt(A/(4*pi)). That gives a value for R of 16.29 centimeters. So, if no part of your antenna comes within 16.29 centimeters of you or your immediate family, you're Ok for power density.

You can repeat the calculation for uncontrolled exposure by using 6 mW/cm^2 instead. That's an area of 16666.67 square centimeters and a R of 36.42 centimeters. So if no member of the public can approach any point on your antenna closer than 36.42 cm, you're Ok on power density.

Note, since your antenna is not an isotropic source, this is a conservative calculation. Actual exposure will be less since all of your power won't be concentrated in the single point on the antenna closest to you. To get the real value, which will be lower, you'll have to use an antenna modeling program. However, since the safe distance is so short, that shouldn't be necessary.

Note also that a gain antenna will have different safe distances in different directions. You'll need more detailed calculations to determine actual safe distances with a gain antenna. In every direction except the axis of the main lobe, the safe distance will be less than for the isotropic case (disregarding strong sidelobes). In the main lobe, the safe distance will be greater than for the isotropic case.

Ok, now we need to look at the magnetic field exposure. For
10m, the limit is 4.89/f or 0.163 A/m for controlled exposures.
To calculate *far field* exposures, we note that the impedance of
free space is 377 ohms. P=I^2*R, so the power density in watts/meter^2
to express a current of 0.163 A/m is 0.163^2*377 or 10 watts/meter^2.
We can plug that into the first calculation like this,

100 watts/10 watts/m^2 = 10 m^2.

That's our A. We can now use R = sqrt(A/(4*pi)) and find that we
need to be at least 0.89 meter from the antenna to be within the
controlled exposure limit. But note that 0.89 meter is *not* in
the far field of the antenna.

The uncontrolled exposure limit for 10m is 0.073, so the minimum
safe distance for the general public is 2 meters. But note that
2 meters is *not* in the far field for a 10m signal.

(Rule of thumb, far field calculations are only valid when you're at
least 10 wavelengths from the antenna.)

The third limit is the electric field strength in volts/meter. For
10m, the limit for a controlled exposure is 1842/f or 61.4 volts/meter.
The impedance of free space is 377 ohms. P=E^2/R, so the power density
in watts/meter^2 needed to express 61.4 volts/meter across 377 ohms is
61.4^2/377 or 10 watts/meter^2. We can plug that into the first calculation
like this, 100 watts/10 watts/m^2 = 10 m^2. That's our A. We can now use
R = sqrt(A/(4*pi)) and find that we need to be 0.89 meter from the
antenna to be within the controlled exposure limit.

I'll leave the uncontrolled exposure limit as an exercise. All you
need to know is that the limit is 824/f. (Actually, all you need
to notice is that the safe distance for the electric field is the
same as for the magnetic field.)

But note again that this is only valid in the *far field*.

Because the safe distances we're getting here for the far field assumptions
are *not in the far field*, there are near field discrepencies not accounted
for. These can be serious as we'll see below.

For example, the Rrad of a dipole is roughly 50 ohms (would be 73 ohms
in free space). At 100 watts, that gives a feedpoint current of 1.414
amperes. The magnetic field declines inversely with distance in the
near field (not the inverse square as is the case for power). So 1.414/0.163
= 8.67 meters. That's the near field safe distance from the current node
in the antenna for the controlled magnetic field exposure. For the
uncontrolled exposure, the minimum safe distance is 19.8 meters. Similarly,
for the electric field, the safe distances are the same, but from the
antenna voltage nodes (the ends for a dipole) instead of the feedpoint.

Now that places the safe distance at about 66 feet for the general
public. That's very different from the 2 meter safe distance we got
with far field assumptions. So why show the far field calculations?

Because at VHF/UHF where the far field is a comparatively short physical distance from the antenna, and where exposure limits are much tighter, the far field values can dominate, especially in the gain antenna case. You need to run both sets of numbers. If the far field numbers actually fall in the far field, use them. Otherwise use the near field numbers.

Note that at HF, particularly lower HF, the near field magnetic field numbers are the ones of concern. It is possible to measure this magnetic field directly with a fairly simple instrument. You should do this to find and map any hot spots. At VHF+, there is no reliable instrument to measure the magnetic near field. Electric field measurements can be done instead since they'll work out to the same distance (except from the element ends instead of their centers). This isn't quite as easy to do, however, because there are more potential sources of error in this measurement. But direct power density readings also become possible at UHF+, and relatively simple instruments can be used to do that to a fairly high degree of confidence. Once you have any one of these numbers, you can derive the others at least to an outer bound.

>battery packs!

There is documented evidence that exposures of greater than 10 mW/cm^2
can cause harm. In particular, cataracts or loss of focal flexibility
due to RF heating of the lens of the eye, and in some cases cancers.
Just as some people get away with smoking cigarettes for years without
getting lung cancer, some people can get away with excess RF exposures
for years without apparent harm. But statistically, the rate of cancers
does increase with exposure in large populations. Milham found a doubling
of cancer rates (compared to the rates of the general population) for some
cancers in his study of deceased amateurs.

The frequencies where (RF heating) exposures are most harmful to humans
are in the range 30-300 MHz. That's why the standards require a lower
exposure at those frequencies than at lower or higher frequencies. The
reason for that is those frequencies are the ones which couple most
strongly to the human body. That doesn't mean we can treat exposures

at other frequencies casually, but the evidence does indicate that higher or lower frequencies don't couple as strongly to the body. Therefore a higher exposure limit for them is tolerable.

The new MPE is 1 mW/cm^2 in the 30-300 MHz region. That gives at least a 10x safety margin (actually, the margin is probably greater than that since 10 mW/cm^2 is about the lower bound for noticable RF heating effects). At 100 mW/cm^2 and higher, however, effects can be very noticable very quickly. There are documented cases of amateurs being blinded by such exposures, literally overnight. (There is also industry evidence, in particular the IBEW has a case file on this.)

Athermal effects, IE effects which aren't a result of RF heating, are a bit more questionable. There are population studies which go either way on this. If there are effects, they appear to either have a weak statistical association, or have to be coupled with an as yet unidentified co-factor. Something appears to happen in some people, but the mechanism isn't understood yet. Athermal effects have been most noticed at lower frequencies, particularly when those frequencies are pulsed at a low rate, IE in amateur radio that would correspond to OOK Morse style signals. In vitro studies have shown changes at the cellular level when exposed to fairly weak pulsed RF fields. In particular, pulse rates in the 5-10 pps range have been shown to cause abnormal chromosome division. This is usually taken as an indication of a cancer causing agent at work.

Sure, those are *data* radios, not synthesized voice radios from
manufacturers with marketing departments who have over-active
imaginations (and no ethics, but that goes without saying).
Note however that the TEKK is much cheaper than a synthesized
voice radio. It is false economy to dedicate an expensive voice
radio (which won't perform correctly anyway) to packet when there
are inexpensive data radios available for the task. (And 56 kb
RF modems that are an even better deal in cost/performance.)

>would mean some changes to both the rules and attitudes. More in a
>later post...

Even with the most liberal possible rules, we aren't going to get
HF links which are faster than local links. I went into detail
why not in another post, the problem is not just regulatory. That's
why using the internet as a model for amateur packet is fatally flawed.
The internet depends on fast long haul trunks (many times faster than
local user connections), and we can't do that. We can do the reverse,
however, and we need to take that into account in designing our
networks.

A purely amateur World Wide Web is out of the question. We have to develop a different paradigm. Our data flow needs to be mostly local. We need local caches. We need to fully exploit distributed processing on a model inverse from the web. (In fact the web itself is going in that direction with things like Java applets.) We need to minimize the traffic required on the long haul links while maximizing local processing.

Several years ago now, before the web, and before Java, I called for exactly this sort of paradigm. I suggested using a Forth-like embedded language which would allow us to exchange single tokens (with a parameter string) representing entire applications to be executed locally. Using a TIL distributed widely over local nets, we could exploit the local net speed and immediacy while still exchanging information with distant stations over lower speed links.

Of all people, Wayne Green supplied the spark for this idea. He wrote an editorial about using message dictionaries to speed up communications. At the time, I was designing a TIL, and the marriage of paradigms came naturally. A TIL is nothing but a cascaded dictionary structure, recursively defining itself until it reaches an execution level.

There was talk a while back about a driver in the works, but nothing yet. I found a way around it though. I use a old 386 with JNOS as my TCP station, and added a ethernet card. I added a attach command to the card, and use OpenTransport (1.1.1b6) to link up to it. I can get and send mail in eudora, use NCSA Telnet. FTP is a little quirky, as JNOS is not standard in this. The biggest trouble with a driver is timeouts. If many hops are involved, Having NCSA Telnet wait 15 minutes for a response is not in the options. To get around this, I telnet into my JNOS system, then

telnet from the JNOS BBS prompt into the site that I wan't to connect up with. There is a driver for DOS/WIN (ETHERAX), but it suffer's from timeouts with slower links (like 1200 bps - Half Duplex RF links, and any link with x hops). Best to try NET/Mac, it works good in the PC based NOS enviorment..>

Thanks for the pointer. The regulation looks fairly ironclad to me. HOA's must allow TV antennas and 1m dishes. I think I will mail a copy of this to my HOA and get rid of the old cable monopoly I have been dealing with. At $30.00/mo., a TV antennas with mast and rotor will pay off very quickly!

>Lets all hope they extend this ruling to the Amateur Radio Service.

The legislation was driven by the type of economics thar we amateurs cannot muster. Also, with fewer people using cable, there could actually be more objections to amateur transmissions in these living quarters built in such close proximity. However, TVI and other interference concerns cannot be extected to improve when a law is issued giving free reign to most types of telecommunications. You can argue for a long time that you use your tribander antenna for TV reception (perhaps not the best reception) on the same antenna that you happen to transmit with. That's *if* anyone notices a difference between a TV antenna and a tribander (say a 10/15/20).
Anyways, it's something to try I guess ;)

>Good Luck with the HOA -- mine is hopeless.

I think after reading the regulation that your >HOA< is out of luck. You would have to have special circumstances affecting 'safety' (this would normally apply to tower hieght with respect to the closest adjacent residence, or possible zoning regulations for wind strength in some areas) or you would have to be in a historic district.

If your HOA does not believe the new regulation, or cannot undertsand it, it seems that you do not have to pay any penalties even if they 'fine' you. Like I say, it looks fairly ironclad but then again I am not a lawyer. I still think anyone having to live with one of these stupid antenna restrictions would be fairly safe going ahead and putting up a TV antenna...not much to lose, and a rather clear federal pre-emption to back you up.

Anything's possible -- ask Beck, Rife, or Lakhovsky. (OK, Beck -- the rest are dead.) But if EM radiation does have non-thermal biological effects, my guess is that at an arbitrary frequency and power level it would be more likely to harm than help.

Hi Norm,

I am using Logwindows 3.0 and it does support accessing all of the popular CD roms. It does allow you to print an address label from the CD ROM as well as a QSL label. I use both features all the time.

4395. The Future Of The PBBS - OUT #4

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-18 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4v857u$9qh@thepit.trucom.com>
Source record: 35191

Hello, Folks:

Again, let me appoligize for my absence from the group for a number of days... It's amazing what a lightning strike does to the inside of a computer!

Anyway, this time, I want to talk a bit about my #4 reason as to why Packet BBSs may be on the way out. To quote from my original message:

>PBBS STATIONS ARE ON THE WAY OUT
> (4) Various policy decisions have stiffled the growth and
> development of effective HF long haul radio networks.

First of all, let me explain what I am talking about here... Mostly, I am refering to regulatory limitations, but the position of some organizations and groups also come into play as well.

One of the most recent and well publicized aspects of this was the debate over unattended HF forwarding. While this has been at least somewhat resolved, it did two things for us... (1) Allowed exploration of the regulations themselves, and (2) Brought to light the real positions of several vocal groups.

Instead of spending time here talking about what can be done to change the attitudes of these groups (this would trigger yet another barrage of messages about who is and is not at fault), I would rather talk about what needs to be done to improve the network, especially the HF network...

Bottom line: We need a high speed, long haul network.

Let's define a couple of terms for this discussion...

HIGH SPEED : Not less than 9600 bps, preferably faster.
LONG HAUL : Single hop of at least 1000 miles. (very arbitray and may vary)

Note this does not limit us to HF or even radio. I won't get into the idea of wired forwarding at this time... We'll save those flames for later.

I see two general possibilities for such a network:

(1) HF links
(2) Satellites

I want to look at both of these a little closer...

HF LINKS

We have at least a rudimentary HF network now. By and large, it is slow, cumbersome, and inefficient. Tests I have done show transist times between continents in days and weeks. A good percentage of messages never even get to their destination.

What causes these problems? I personally think it is a combination of expense and frustration... It is expensive to put up a good HF, state of the art station (I won't list the costs, but they are not cheap). I think that many HF operators get frustrated by the regulations and by frequent complaints from Packet users and SysOps about network problems.

As far as expense goes, perhaps we need to explore ways to make it cheaper to get an HF station on the air. If you ask me, a Clover card in the $500-$1000 range is a bit steep. I leave this to the technical experts.

For the frustration, however, there are several things that all Hams can do to help out...

(1) Stop complaining unless you can offer something constructive. This may be ideas, $$$ (see above), or ????. If only a small percentage of the efforts, time, and energy spent on DEBATE, SALE, PONDER, NOCODE, CW, and a maze of other topics were to be spent on network development, we would be way ahead of the game.

(2) Begin to ACTIVELY pressure the various regulatory bodies to make changes to the rules. We need to have the ability to do full unattended operations, higher "speed limits", and use of new protocols. (see more later) This would also involved putting pressure on the several major Ham Radio organizations to support such an endevor... It seems that most groups are at best ambivilant and at worst opposed.

SATELLITE LINKS

Satellites offer perhaps the best chance for a true high speed Ham network. We would instantly remove most of the speed and operational limits imposed by the rules. The downside is the cost and lead-time involved in getting such a network in place.

Ground station costs would be, for all practical considerations, a small problem... As Gary Coffman suggested, we need very high speed LANs and at least medium speed long haul links. How about this... Use 56 Kbps on the LAN with 9600 bps user access, then link the LANs together via T1 or T3 sat. links? This way, only one point in a LAN would need to have the expensive high speed gear.

The use of geosynchronos birds with ability to link both to the ground and to each other at T3 speeds would allow very fast contact between

any two points. (I leave it to those that know about these things to figure out how many sats would be needed, where they should be, etc.)

The costs for the satellites would, however, present a big problem... I have no idea how much this would cost myself, but I suspect that we are talking about a VERY large price tag. I can forsee needing somewhere around 5-7 birds for global coverage. Perhaps someone has some sort of handle on how much $$$ we are talking about.

The other big problem would be lead-time... Does anyone know just how long the Pahse 3-D bird has been in development? Seems like forever to me! Of course, this not something that can be done overnight, especially by a bunch of volunteers. The problem is that if it takes us ten years to get the network in place, there probably won't be much need for it by then. I again hope that someone has a better grasp of what the lead-time on such a project might be...

OTHER CONCERNS

Let me go back to the high speed HF links for a moment... I have some questions that I would like to hear other people's thoughts about.

Other than the bandwidth needed and the current rules, is there a reason that high speed data could not be sent on HF?

If we ignore the limits set by the rules, what sort of bandwidth would be needed to send data at, let's say, 9600 bps on the HF bands?

How many "channels" would be needed in each band to allow for effective traffic patterns?

Where could we get the needed bandwidth? Is there room in the current Ham bands? Why don't we just take 11m by force for data use? ;-)

On the surface, at least, it seems that it would be desirable to have high speed "sub-bands" on several of the HF bands to allow for changing propagation (perhaps even with some sort of system to allow automatic, unattended band switching to maintain contacts). If this is the case, wouldn't the questions above become compounded?

What about 6m? We wouldn't get the range of HF, but some of the regulatory problems would be gone.

I don't claim to have any answers, only interesting questions. My only hope is to get folks to stop bitching and start thinking.

Again, any comments, flames, ??? are welcomed.

> while providing all the same channel reallocation benefits.

On-air tests of real systems show that spread spectrum cellular systems
(e.g., IS-95 CDMA) achieve capacities of perhaps 6x those of digital
TDMA systems (IS-54, GSM)

> Better yet, it doesn't take a Phd. to understand it.

I don't have a PhD, yet I believe I have a pretty good understanding
of spread spectrum.

> These snake-oil salesmen have sold people on the idea that somehow
> we can get more signal thruput by using spread-spectrum - BULLSHIT!
> It is NOT a perpetual motion machine.

You're right -- unlike a perpetual motion machine, spread spectrum
works as advertised -- it actually does achieve greater
spectral efficiencies in an interference-limited, frequency reuse
environment. That's because the extra bandwidth taken up by spreading
is more than repaid by the enhanced interference resistance -- something
TDMA doesn't have. CDMA cells can actually overlap on the same
channel without interfering with each other. In contrast, all narrowband
schemes (TDMA and FM) require frequency reuse patterns that allow
only a small fraction (e.g., 1/7) of the total spectrum to be used
at any one cell.

> The real benefit lies in that it is inherently encrypted, and
> that these high-compression heads can line their pockets with
> the U.S. government's research dollars. What a SCAM!

Nonsense. The parameters of the IS-95 CDMA waveform are publicly
available. Although CDMA is harder to intercept at present than
TDMA or FM, that is likely to change with time as the chips and
phones become widely available. In my opinion, there ought to be
extra encryption to protect privacy, because the "inherent encryption"
is quite weak.

Source record: 35194

Hello folks,

We have sometimes big problems with our FBB systems on their telephone modem ports, in case of lightning, storms etc. Sometimes our modems become burnt due to lightning, sometimes other comports too. We wonder how to prevent failures on comm devices and ports itself, if the bbs is located at the repeater point on the mounteen far away, and can't be switched of before the lightning. Interesting is that we don't have any trouble on our RF lines and TNC's, but only on telephone lines/modems.

Any useful help will be appreciated and granted with our qsl picture card!

4399. The Future Of The PBBS - OUT #5

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-18 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4v8581$9qh@thepit.trucom.com>
Source record: 35195

Hello, Friends:

This is the last of my comments about why the Packet BBS may be on the way out and will address my reason #5:

>PBBS STATIONS ARE ON THE WAY OUT
> (5) Continued in-fighting in the Amateur ranks stiffles both
> long haul and short haul network growth and development.

This problem will come as no surprise to anyone who has ever owned a TNC. Just take a look at the bulletins that fly back and forth on Packet and you will see this everyday.

On a larger scale, we have some groups that, for whatever reasons, are actively against Packet or some part of Packet. (for example, in some areas, TCP/IP is not well received)

WHAT CAUSES THESE PROBLEMS?

I can only speak from personal observations, but I see a large amount of spill over to Packet from the larger fight between the "Pro-Code" and "No-Code" factions. It seems that many "Pro-Coders" see many "No-Coders" as being heavily into digital modes and will oppose any advancements to digital on this basis alone. On the other hand, I see many "No-Coders" doing two things: (1) Proposing crazy, half-baked ideas with the intent of irritating the "Pro-Coders" and (2) Not listening to the experience and knowledge of the the "Old Timers" just because they happen to also be "Pro-Coders".

Like Rodney King said, "Why can't we all just get along?"

Also, ego seems to be a big part of the problem. In this area, there are a few SysOps and NodeOps that refuse to pass certain traffic on there stations... One NodeOp will not allow TCP/IP traffic to go through his Nodes. One SysOp refuses to pass ALL@??, ??@WW, and FBB@?? traffic. When questioned about this, the replies are always the same: "It's my station, I built this network, and it will be run the way I want to be run or I'll shut down my station(s) and cripple the whole thing."

I'm sure that there are other reasons, but it is really beyond the scope of this article to deal with the psycho-social dynamics of this group.

WHAT CAN BE DONE?

Good question... It needs to be addressed in two parts:

(1) GROUPS : This is the easy part... Everyone who is interested in digital modes, especially the Packet network, needs to take action to put pressure on all the relavent groups (national, regional, and local) to change their official and unofficial positions. How? Join, get active, vote, and in general raise a little hell.

Using the ARRL as an example, join and pay your dues (QST is worth that expense). Vote in the elections. Write to your SM, DD, and the Board expressing your views. The SM and DD phone numbers are in QST, so you can even call and yank their chains once in a while. (other groups will be similar)

Once we get their attention, they will come around... One way or another.

(2) INDIVIDUALS : This is harder. When one person has the ability to disrupt the network, even on a local level, there is a problem. In some cases, there may not be anyone else in the area who has: The skills; The equipment; The $$$; or The _____ (fill in blank), to take over the functions that the "problem child" is now providing.

It seems to me that there is no blanket solution to this... Each case would need to be handled locally.

OVERALL

In closing, I leave you with the following thoughts:

(1) The fighting is damaging to the ENTIRE network and to all of Ham Radio in general.

(2) The "No-Coders" are here to stay. Like it or not, you have to live with them. Many "No-Coders" are from highly technical backgrounds and have a lot of knowledge that is VERY valuable. If the "Pro-Coders" will stop whining long enough, they would learn that.

(3) The "Pro-Coders" have been around a while and have a lot of knowledge that is VERY valuable. If the "No-Coders" will stop whining long enough, they would learn that.

4400. Baycom modem - need some help please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-18 00:00:00 UTC
From: Nuno Sucena Almeida <slug@this-news-group-please>
Message-ID: <gi27v4.lm6.ln@localhost>
Source record: 35196

Hello...
ATENTION:reply in this newsgroup or to slug@cygnus.ci.uc.pt

Two weeks ago i build the famous baycom 1k2 modem but unfortunatly i
can't make it work. It seems to transmit well as i can hear the tones (
like some noise) and seems to receive/demodulate well, but i'm not sure
since i don't have a scope...I think the problem is the discrepancy of
voltages as the computer is a PC with RS232 at 12V and the modem is
working at 5V (getting the voltage from the RS232).
I don't know were I got the schematics, but could someone point me a site
were i can get a working one for PC.
The power voltages are correct (aprox 4.95V) when it transmits and when
in stanby (receive) mode and when i put a multimeter (digital but with
two scales, one that simulates a analog,ie, very fast) at the CTS port
it changes rapidly when the modem receives the audio...
Another thing:The radios that i'm using can't disable the squelsh so its
always silent with no receiving signal.So, does the baycom modems needs the
random noise produced at the FM receiver?

The softwarez that i'm using are:

-linux 2.0.7(since i can make ping -i 5 baycomIP and try to receive without
boring another dude and when if it works to play MUD's with all my
friends :)
-baycom software (first try but since i don't understand deutsh :(
-NOS (second try with AX25.COM driver , several versions (TNOS, JNOS,
etc ...)
-TPK (with the drivers for the baycom...)

With all of these software i can transmit but not receive but
with linux i haven't tried to receive since i haven't read the DOCS
on how to do it YET.

tks in advance...

I made an error here. I forgot to include the factor of 2*pi in the
above figures. That reduces the safe distance for controlled exposure
to just 1.38 meters, and for uncontrolled exposures to 3.15 meters.
That's much better.

More like "just wishful thinking" I'm afraid. If this were true,
the results of the Milham study would have gone the opposite way.

Yes, its called Linux.
Run your MUD on a linux server and you can easily allow users to connect
either via IP/AX25, or via native AX25 connections, while simultaneously
running any number of other services as well.

Check:

http://sunsite.unc.edu/mdw/HOWTO/AX25-HOWTO.html

> that talented at low-level electronics...
> Where can I find information on this type of thing?Hi Daniel,

there are at least three products on the market which would fit your
needs, if they are approved by FCC-rules ...
There are Ethernet-Radio-Bridges, which links standard thin-wired
ethernet trunks together via a 2,3GHz-connection (frequency hopping,
2MBit/s bandwidth).
Here in Europe those radio lans have a general approval by all european
telecommunications offices (CE-approval), you could use them without any
further notice or paying any fees ...
I'm not sure, but I think that those devices should be useable in the USA
also. The power is 100mW EIRP, which is ok for about half a mile with a
vertical dipole, up to 5 - 6 miles with a 12dB-antenna ...
A bridge (2 divices) will cost here approx. 5.000 USD with antennas!!!

If your interested in that, I could try to find the manufactures info ...

Fantasy? RF is used all the time in medicine. Tell that to the
Chiropractor that totaly screws up 10m with his massaging wand. Uses
RF in the 27-28 MHz band to warm tissue deep inside. Tell that to my
Dentist who used an 'Radio Scapel' to trim back my gums the other day.

>show 1 in 4 women will suffer from that form of cancer. But let's please
>keep emotion out of this ruling. Self-denial that RF cannot cause illness

>of thousands of folks is irresponsible.

No self denial. It would be irresponsible to keep quiet and bend over
for crap like this. They show proof that it harms, and how, then we
will worry about it. I thought we stopped using 'blood-letting' as a
treatment a long time ago, what they sugguest is the same thing.

'We don't know what it is, or if it is at all, but slit their rists
and let some blood out just in case.'

Compliance in the face of stupidity is cowardice.

When did Part 97 start requiring people to use the lowest power setting all the time? I believe you're referring to 97.313(a), but you're apparently misreading it. 97.313(a) says "An amateur station must use the minimum transmitter power necessary to carry out the desired communications". There is a difference between 'minimum transmitter power' and 'minimum transmitter necessary to carry out the desired communications'.

I don't disagree that minimizing RF exposure is a good thing. I just don't agree with this reading of Part 97. Using the lowest power setting without regard to the ability to carry out communications might be considered 'liddish' by some ;-).

4411. KPC-3 128k Help needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-19 00:00:00 UTC
From: kenn2sqw@aol.com
Message-ID: <4vbbac$hdi@newsbf02.news.aol.com>
Source record: 35107

I just upgraded my KPC-3 to 128k. Is a hard reset needed to recognize the new amount of RAM? I still can't get the mailbox to go past 22k, and hate to do a hard reset (and have to re-do all of my settings) unless it's needed to recognize the new amount of memory. Has anyone had any experience with this??
Please reply via E-Mail if possible.

Unfortunately, your emotionally charged arguement is all you have to
prove your point that regulation is needed to the level it has been
applied.

It would be much better if we could ignore the people who wanted
to pass laws based on ficticious or emotionally founded fantasies.

Every so often the government does that, goes out on a "jag". They take
some information that is normally quite emotionally charged and use
it to pass laws that far surpass the need.

A good example was the "fact" that 50,000 children a year are abducted
and we needed new laws to stem this tide. They passed a bunch of new
laws, citing the dopey figure, without ever considering that it was
a lie. The laws remain to show how harmful a well-meaning but terribly
misdirected group can do.
